

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### **Usage guidelines**

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### **About Google Book Search**

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

A NEW  
COMPLEAT and UNIVERSAL  
SYSTEM or BODY  
OF  
DECIMAL ARITHMETICK,

CONTAINING,

- I. The Whole *Doctrine of Decimal Numbers*, not only the Plain and Terminate, but also such as *Repeat or Circulate ad Infinitum*; and a Plain but Perfect *Management* of both, laid down and explained in all the *Fundamental Rules of Plain Arithmetick*, and by *Logarithms*.
- II. The Application and Use of *Decimal Arithmetick* in all the *Parts or Branches of Arithmetical Science*; viz. *Vulgar Arithmetick, Vulgar Fractions, Duodecimal, and Sexagesimal Arithmetick*; also in *Algebra and Logarithms*. In all which its *Excellency* and absolute *Necessity* is fully evinced.
- III. Its Application and Use in all such *Parts of the Mathematicks* as absolutely require its *Assistance*; viz. *Plain Trigonometry, and the Arts* depending thereon; as, *Navigation, Fortification, Altimetry, and Longimetry*; Also the *Mensuration* of all Kinds of *Superficies and Solid Bodies*; and the Arts resulting therefrom; as, *Gauging, Surveying, &c.*
- IV. A *New and Compleat Set of Decimal Tables* never before published, shewing by Inspection the Value of all Kinds of Decimals (without the tedious Methods of Reductions hitherto used) to four or six Places of Figures; Also all the *Common Tables* very much *enlarged, corrected, and improved*; wherein all the *Circulating Numbers are marked*. With all other *Tables of Interest, Annuities, Exchange, &c. necessary* to render the Work *complete*.
- V. An exact and accurate *Canon of Logarithms* for natural Numbers. And thro' the Whole, several Things new and useful, not here express'd.

# The P R E F A C E.

**I** Presume 'tis entirely needless to write a Panegyric on the superlative Excellency of the noble Science of Decimal Arithmetick, since the World has already been sufficiently apprized thereof in the extream Benefit and Service it has afforded the World of Mathematical Literature, even tho' in its Embryo State; much less doth it need Encomiums to set forth its Nature, Worth, and valuable Properties, which have been discovered and illustrated by late Improvements; of which the ensuing Work is but (as it were) an Instance.

The Book I here present the World withal is a regular System of this valuable Art, according to all the latest Improvements of others, and many (in the several Parts thereof) of my own; the two greatest of which are, The Doctrine of infinite circulating Decimals by the learned Mr. Samuel Cunn; the other, A New Sett of Tables shewing the Value of any Decimal Part of any Integer, whether Money, Weight, Measure, Motion, Time, &c. by Inspection only, to a sufficient Exactness, without the tedious Reductions hitherto necessarily used; which cost me not a little Time and Pains to calculate, but was necessary to render this Art compleat.

The Foundation on which I have built this Superstructure is the abovementioned Gentleman's small, but learned, Treatise of the Doctrine of Decimal circulating Numbers: But that great Master having laid the Foundation deep, and in a great Measure out of the Vulgar Ken; I thought it might be of Service to young Students, a little to disclose and lay it more open to their View, and this was all I at first intended to do; but having done that, Materials came in so fast, that I went on and erected the System of Decimal Science thereupon, as you here see it; of which take the following Account.

4-16-18. m.c.

## The PREFACE.

*In the Fundamental Rules of the Art, viz. Addition, Substraction, Multiplication, and Division, I have been as plain as possibly I could without Prolixity, and shewn the compleat and perfect Management of both Plain and Circulating Decimal Numbers in each of the Rules, in so easy and obvious a Method as the meanest Capacity, with proper Attention, may comprehend; and have taken care, in its proper Place, to give the true Reason, or Rationale, of each particular and different Process, especially of those relating to Circulating or Repeating Numbers of all Kinds, as I went on, omitting nothing that I could communicate towards the perfecting this fundamental and important Part.*

*In Reduction I have perfected this Art beyond what it hath ever been; as I have not only largely exemplified all the common and vulgar Methods of Reducing to, and from Decimals, in all kinds of Vulgar, Fractional, Duodecimal, and Sexagesimal Numbers, by Arithmetical Operations; but have compleated the Tabular Part, which has been hitherto very deficient, both in the Tables already extant, and in the Want of others. The first of these Defects I have endeavoured to supply by correcting, enlarging, and compleating the common Tables for reducing the various Denominations of all Kinds of Quantities to Decimal Numbers; wherein I have taken care to mark all the Circulating or Repeating Numbers, Single or Compound, so far forth as they came within the Verge or Limits of the said Tables; which hath not till now been done by any. The other Defect, and that which renders this excellent Art most lame and imperfect, viz. The Want of proper Tables to express again the Value of a Decimal in the Vulgar Denominations, or known Parts of its Integer, without tedious and operose Arithmetical Reductions, I have also supplied by the Addition of a compleat Set of such Tables, and shewn their Use in Examples of all Varieties. The Reader may have a farther Account of these Tables in the Place where they are inserted; of which I shall say no more, but that these are the first Tables of this Kind that were ever published.*

*What I have hitherto said, relates purely to the Nature  
and*

## The P R E F A C E.

*and Substance of the Art it self ; what follows concerns its Application to Arithmetical and Mathematical Sciences.*

*In Vulgar Arithmetick, I have applied the Doctrine of Decimal Numbers, both Plain and Circulating, in every Part ; and shewn its admirable Use, Service, and Expediency thro' the Whole. Particularly I have facilitated the Business of Practice by a new Table and Method of Working by Decimals ; whereby the Difficulty and the Intricacy of this Rule by common Arithmetick is avoided.*

*In Inchange I have been very particular and explicit, having made this Affair (the Basis of Merchandise) more intelligible to meaner Capacities than I have met with it ; explained the Nature and Meaning of the Par and Course of Exchange, and have exhibited large and compleat Tables of both ; such as are very rare to be found in Books of this Nature, tho' they are an indispensable Part of Decimal Arithmetick. The Rules of Interest, Simple and Compound, being of so great and general Concernment and Importance, and yet so little truly understood, I have taken abundance of Pains and Care to let young Students see the Theory, or true Reason and Nature thereof, by a perspicuous Method of Resolving the most excellent Theorems of the late Mr. Ward, in Decimal Numbers ; which in this Part of Arithmetick are absolutely necessary. And to facilitate and expedite Calculations of Interest, I have procured a compleat Set of Decimal Tables of Interest, and shewn their Construction and Use. In the other Parts of common Arithmetick, I have been large and clear, and omitted Nothing that I could contribute to perfect them. In fine, in every Part I have shewn the Necessity and Expediency, and in the Whole, the Preference and superior Utility of Decimal Computations.*

*In Vulgar Fractions, I have shewn how all Questions are most easily and commodiously resolved by Decimals ; and for that End have calculated a Table shewing by Inspection the Decimal equal to any Vulgar Fraction whose Denominator exceeds not Twenty, I have extended the Table no farther, because those small Fractions are most frequent and useful in Business.*

*In*

## The P R E F A C E.

*In Duodecimal and Sexagesimal Arithmetick, I have shewn the Nature and Rules of the Arts; and, by many Examples, how Questions are most advantageously wrought by Decimal Numbers, especially in Duodecimals, so much used in Mensuration, I have also inserted compleat Tables for turning Duodecimal and Sexagesimal Numbers into Decimal ones, and such as are not to be found every where; wherein (as in all my other Tables) I have noted the Circulating Decimals, which no one besides hath done.*

*In the excellent Art of Logarithms, I have not only explain'd the Principles and Rules of the Art it self, but largely shewn how all Kinds of Decimals are managed and ordered thereby; others have taught the World the Management of plain or terminate Decimals by Logarithms; But that of circulating or repeating Decimals of all Kinds, hath fallen to my Province only, since no one before has attempted it. I have here explain'd the Method of finding the Logarithms of any Repetend, whether single or compound, pure or mixed with absolute Numbers, with more Ease and Certainty than can be found for any terminate Decimal exceeding the Numbers in the Canon. I have shewn how to work all Sorts of Decimals in all the Rules of this noble Art; and to make this Part of the Work compleat, I have inserted a Canon of Logarithms for Natural Numbers; where by Rules you are taught to find the Logarithms of any Number not exceeding 10000000, and the contrary.*

*In Algebra, the Use and Necessity of Decimals in raising and resolving Equations, I have demonstrated in a Select Number of the most curious and useful Questions relating to the Theory of Arithmetick, to the Philosophy of Motion, &c. and shewn how lame and imperfect, even this most perfect and perfecting Art would be without the Subservience of Decimal Numbers.*

*Hitherto of the Use and Application of Decimals in the severall Parts of Arithmetical Science; in the next Place take what concerns its Application to the Principal Parts of Mathematical Knowledge.*

*In Plain Trigonometry, I have convinced the Reader how absolutely necessary Decimals are in order to express  
the*

## The P R E F A C E

*the Quantity of the Sides of all Right-lined Triangles, in the Solution of all the Cases of Right and Oblique-angled Trigonometry. And as this Art is the Foundation and Essence of several others, as Fortification, Navigation, Mensuration of Altitudes and Distances, &c. I have likewise shewn the Nature and Rudiments of those Arts and Sciences, and the Manner of performing Conclusions by them in Decimal Numbers. So that any Person may here both learn the Art of Trigonometrical Calculation, and its Application to the aforesaid Arts, after the best Method, with the same Ease and to as good Purpose, as from many Books wrote purposely on the Subject.*

In the Mensuration of Superficies and Solids, no one will pretend to dispute the Superlative Use of Decimal Arithmetick; whereof the small Tract I have here publish'd is a sufficient Instance. I have not only taught how to measure more Superficies and Bodies than any other one Book that I know of, but shew'd how this Art is the very Basis and Substance of Gauging, Surveying, and all other Kinds of Measurements used by Artificers, none of which can be obtain'd to any good Purpose without it; nor any Operations therein so well perform'd as by Decimal Arithmetick; and here I have provided the Gauger with a Table of Multipliers or Divisors for finding the Content of any Superficies, or the Capacity of any Vessel in Wine Gallons, Ale Gallons, Corn Gallons or Corn Bushels, whether the Dimensions be taken in Inches, Feet, or Yards.

Thus I have given a general Account of the Substance of the Book; it would be endless to descend to Particulars: Many Things of Importance in various Parts of the Book will offer themselves to the View of the Reader unexpectedly, and appear in the whole, with the Face of Novelty. I have spared no Pains in Consulting the best modern Authors on each particular Head as I went on, and extracted from them severally whatever I found of value and Worth and would contribute to perfect my Design; so that nothing of Consequence can be found in any other Piece of Decimal Fractions (as this noble Art has been diminutively called)

## The P R E F A C E.

led) but what may be here met with amidst a great Variety of other novel, but useful and curious Matters.

So that upon the Whole I hope this Book doth truly merit the Title it bears, viz. A New Compleat and Universal System or Body of Decimal Arithmetick.

If then any Person be desirous of a Good and thorough Knowledge of Decimal Numbers of every Kind, and of their Compleat and perfect Management by the Rules of Art, they may be here satisfied. If they would learn its Application, or how to use it to the best Advantage in the various Arts, Trades, and Business of Life, they will here meet with plentiful Instructions, and Examples in every Sort, adapted to particular Cases. Would they learn the true Grounds, or Rationale, of all Arithmetick whether Vulgar, Fractional, Duodecimal, Sexagesimal; and of the Mathematical Arts, Mensuration, Gauging, Surveying, Navigation, Fortification, Altimetry, Longimetry, &c. let them please to spend a few of their spare Hours here. Are they disposed to learn the Use of Logarithms, or the Method of Trigonometrical Calculations; they are here with Ease informed. In short, they may here find in one small Volume, what I have been obliged to turn over many both small and great to procure; and therefore if Variety, Utility, Novelty and Brevity can please, I hope the Publick will candidly accept my Labours; I am not apprised of any Faults therein, and am very sure there are but few material Ones, having taken all the Care and Pains I was able, to prevent them.

But if the well dispos'd and inquisitive Reader, after having perused it thoroughly, shall then judge it deficient; I should be very glad if any thing better of the Kind should offer, that may afford him greater Satisfaction; and till then only, I entreat his kind Acceptation and candid Perusal of This.

T H E  
I N T R O D U C T I O N,  
C O N C E R N I N G

The Nature, Kinds, and Notation, of  
D E C I M A L N U M B E R S.

1. **T**H E excellent Art of *Decimal Arithmetick* derives its Name from a Latin Word (*viz. Decem*, Ten) which denotes the Nature of its Numbers, which represent the Parts of any *Integral Quantity* divided in a *Decuple*, *Decimal*, or *tenfold Proportion*.

2. Any Integer, or whole Quantity, being divided into 10, 100, 1000, 10000, &c. Parts, because those Numbers are in a *Decimal* or tenfold Proportion; therefore such Numbers as represent any of those Parts, are call'd *Decimal Numbers*, or *Decimals*.

3. Thus, suppose I divide any whole Quantity into 10 Parts, and take 7 of them; those are call'd 7 decimal or tenth Parts of that Integer; and are thus vulgarly wrote  $\frac{7}{10}$ ; suppose it divided into 100, 1000, &c. Parts; then 7 of them would be express'd thus  $\frac{7}{100}$ ,  $\frac{7}{1000}$ , &c. and read as before.

4. Also many Integers and Parts of another, would be express'd thus,  $8\frac{7}{10}$ ,  $19\frac{67}{100}$ ,  $475\frac{154}{1000}$ ,  $2\frac{2946}{10000}$ , &c. and read thus; 8, and 7 tenths; 19, and 67 Hundreths, or Parts of a 100; 475, and 154 Thousandths, or Parts of a Thousand; 2, and 2946 Parts of ten Thousand. Thus the *Denominator* of Decimal Parts or Numbers, is always an Unite with Cyphers annexed.

B

5. There-

5. Therefore if the Places of Figures in the *Numerator* be equal in Number to the Places of Cyphers in the *Denominator*, (or be made equal thereto, by prefixing Cyphers;) the *Denominator* in such a Case will be known, though it be not written; and therefore in the Notation of Decimal Numbers, is always omitted; and the *Numerator* (ordered as aforesaid) alone is join'd to the *integral Quantity*, with a *Comma*, or *Point*, to distinguish it therefrom.

6. Hence  $\frac{34}{100}$ ;  $\frac{45}{1000}$ ;  $\frac{57}{10000}$ ;  $\frac{27}{100000}$ ;  $\frac{4}{1000000}$ ; &c. are thus written, .34; .045; .0027; .004. Also  $27\frac{3}{10}$ ;  $58\frac{4}{100}$ ;  $129\frac{33}{1000}$ ;  $1\frac{7}{10000}$ ; are wrote 27.3; 58.04; 129.0132; 1.0017. And on the contrary, by .12; 1.76; .006; 2.003; .001; we understand  $\frac{12}{100}$ ;  $1\frac{76}{100}$ ;  $\frac{6}{1000}$ ;  $2\frac{35}{10000}$ ;  $\frac{1}{1000}$ .

7. Cyphers prefixed to decimal Numbers, decrease their Value in a decuple or tenfold Proportion; as affixed to Integers, they increase their Value in the same Proportion: thus .5; .05; .005; .0005; &c. are, as they proceed, each one ten times less then the preceding Decimal; as is easy to conceive.

8. When the *Denominator* is an Aliquot Part of the *Numerator* increased by Affixing Cyphers thereto, the Decimal equivalent to such a Fraction, will be compleat and terminate; as,  $\frac{1}{2} = .5$ ;  $\frac{1}{4} = .25$ ;  $\frac{1}{5} = .2$ ;  $\frac{1}{8} = .125$ ;  $\frac{1}{10} = .1$ ;  $\frac{1}{20} = .05$ ;  $\frac{1}{40} = .025$ ;  $\frac{1}{30} = .333333$ ;  $\frac{1}{300} = .003333$ ;  $\frac{1}{80} = .125$ .

9. But if the *Denominator* be no aliquot Part of the *Numerator* thus increased; the Decimal equivalent to such a Fraction will be interminate or endless; that is, it will constantly repeat one Digit only; as  $\frac{1}{3} = .333333$ , &c. *ad infinitum*; or  $\frac{1}{6} = .166666$ , &c. or  $\frac{1}{12} = .083333$ , &c. or  $\frac{1}{7} = .142857$ , &c. or  $\frac{1}{27} = .037037$ , &c. *sine fine*.

10. Or else a certain Number of Figures perpetually Circulate, or repeat in the Quotient. Thus  $\frac{1}{7} = .142857$  142857, &c. *ad infinitum*; also  $\frac{1}{17} = .0588235294117647$  0588235294117647, &c. And  $\frac{1}{9} = .111111$ , &c. And  $\frac{1}{11} = .090909$ , &c. without End. And those Numbers which thus infinitely circulate or repeat, are most fitly termed *Repetends*. Those which circulate a Digit only, are called a *single Re-*  
*petend*;

### Nature, Kinds, and Notation of Decimals. 3

*petend*; and those in which several Figures circulate, are call'd a *Compound Repetend*, in the following Tract.

11. For the greater Elegance and Perspicuity, in all the Operations of Circulating Numbers, I have dashed the first and last Figure of the *Repetend*; thereby making one Place of the *Repetend* sufficient. Thus the Examples above are thus wrote or expressed;  $\frac{2}{3}$ ;  $\frac{1}{2}$ ;  $\frac{58}{100}$ ;  $\frac{138}{1000}$ ;  $\frac{0322916}{1000000}$ . And the *Compound Repetends* thus;  $\frac{.x8}{9}$ ;  $\frac{.x8}{99}$ ;  $\frac{952380}{999999}$ ; and  $\frac{.0138}{999}$ ; herein following the Ingenious Mr. Cunn, the first Improver of this Part of *Decimal Arithmetick*.

12. In a *Compound Repetend*, any one of the circulating Figures may be made the first of the *Repetend*; for Instance, in the *Repetend*  $8.6\overline{22}5325325$ , &c. it may be made  $8.6\overline{22}52$ ; or  $8.6\overline{32}532$ . And by this Means any two or more *Repetends* may be made to begin and end in the same Place; and then they are said to be conterminous.

13. Several other Things relating to the Nature and Properties of circulating Numbers, I have interspersed in the following Treatise in their proper Places, where they may be understood, and which are not to be found in any other Book of *Decimal Arithmetick*.

14. In all *Decimal Numbers*, if the Point of Distinction be removed one Place towards the Right Hand, every Figure, and consequently the Whole Expression, will be increased in a tenfold Proportion; as in those Decimal Expressions  $3.756$ ,  $37.56$ ,  $375.6$ ,  $3756$ . which are each one 10 times greater than the preceding one. In which Proportion also, 'tis manifest, they decrease in Value, by removing the Decimal Point a Place to the Left Hand.

15. The Nature and Properties of *Decimal Numbers*, are the same with those of *Integers* or *Whole Numbers*, and the Method of Working both the same (excepting *Repetends*). Hence arises the Excellency and superior Usefulness of *Decimal Arithmetick*, above all other kinds of Computation.

16. To make the preceding Proposition evident, suppose 'twere required to express the Time since our Saviour's Incarnation to the Year present, in Centuries and Decimal Parts of a Century; it would be thus  $17.33$ ; where you observe one half of the Number consist of *Integers*, and the other half of *Decimals*. But suppose the Time ex-

#### 4 *The Introduction, concerning the*

Pres'd in Years, the Number consists of the same Figures, 1733; and is whole or integral.

17. Hence 'tis plain the same Number may be either *Integral* or *Decimal*, and that either in Whole or in Part, according to what is made the Integer; for in the foregoing Case, if a Myriad be the Integer, the Time will be expressed by a pure Decimal 0.1733; if a Century be the Integer, by a mix'd Decimal 17.33; if a Year be the Integer, by the integral Number 1733; as before.

18. All the different Species, or Parts of different *Kinds* and *Denominations*, of *Money*, *Weights*, and *Measures*, and all other Quantities, are to be reduced to *Decimals*, or may be expressed in *Decimal Parts* of their respective Integers, by proper Tables calculated for that Purpose; also any *Decimal* may very nearly by Inspection only (without the tedious Reductions hitherto used) be read in the vulgar Parts or Denominations of its respective Integer, by a Set of new Tables, which I have compos'd for the Ease of those who are conversant in this excellent Science.

19. Since then it has been shewn that *Decimals* are the same with *whole Numbers*, as to their Nature and the Manner of Operation; and that all mix'd Numbers, or such as consist of divers and different Denominations, are reducible thereto, and *vice versa*; it follows that all the Arithmetick of mix'd and heterogeneous Numbers is to be perform'd by *Decimals*, with the same Ease, Expedition, and Pleasure as that of *whole Numbers*.

20. And by Consequence, That *Vulgar Arithmetick*, *Vulgar Fractions*, *Duodecimal* and *Sexagesimal Arithmetick*, (those Parts of the Science of Computation hitherto deem'd so hard and intricate, and therefore but little studied or known) are all by this noble Art of *Decimal Arithmetick* perform'd with the utmost Ease and Pleasure, that any Arithmetick is capable of, and which I have abundantly evinc'd in the Sequel of the ensuing Work.

21. The Figures of a *Decimal Number* are to be numerated as those of whole Numbers, *viz.* from the Right Hand to the Left; but they must be denominat'd of the Number of Parts the Integer is divided into. The following Table will make the Numeration and Denomination of Decimals very easy.

A TABLE of the Numeration and Denomination of  
DECIMALS.

Integer	Tens	Hundreds	Thousands	Tens of Thousands	HundredsofThousands	Millions	Tens of Millions	Hundreds of Millions	Thousands of Millions																	
1	0	0	0	0	0	0	0	0	0	0	== Parts of the Integer.

0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	6	7	8	9					
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	5	6	7	8	9				
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	4	5	6	7	8	9			
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	3	4	5	6	7	8	9		
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	2	3	4	5	6	7	8	9	
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	2	3	4	5	6	7	8	9

These Numbers are all of them the respective Parts of a Thousand Millions, into which the Integer is divided as above.

An Explanation of the Characters and Abbreviatures<sup>s</sup> used in the following Book.

It has been of late an Expedient to avoid Prolixity in Writing, to make use of some convenient and significant Characters to express those Words which most often occur, and occasion Tedioufness and Tautology in the Work, the most irksome Vices that can attend it; and accordingly I have here used them; which, with their Significations, are thus to be understood.

<i>Figure.</i>	<i>Names.</i>	<i>Significations.</i>
+	Plus, or more.	As $a + b$ , is $a$ more $b$ ; in Addition.
—	Minus, or less.	As $a - b$ , is $a$ less $b$ ; in Subtraction.
x	Multiplied into.	As $a \times b$ , is $a$ multipl. into $b$ ; in Mult.
÷	Divided by.	As $a \div b$ , is $a$ divided by $b$ ; in Divis.
=	Equal to.	As $a = b$ , is $a$ equal to $b$ ; in Equat.
∴	Is to.	} As $a : b :: c : d$ ; as $a$ is to $b$ , so is $c$ to $d$ ; in Proportions.
∴	So is.	
⊙	Involvd.	As $2 \odot$ , is the 2d involvd.
ω	Evolved.	As $2 \omega$ , is the 2d evolved, or extractd.
√	Surd Root.	} As $\sqrt{ab}$ , $\sqrt[3]{ab}$ , $\sqrt[4]{ab}$ , &c. is the Root Square, cub'd, biquadrate, &c. of $ab$ a Surd.

## C H A P. I.

### *Addition of DECIMALS.*

**A**ddition of Decimal Parts admits of various Cases, according to their different Kinds; either as they are *terminate and compleat*, or *interminate*, and continually *repeat* either *one or more* Figures. I shall illustrate all the several Varieties by suitable Examples of *Money, Weight, Measure, &c.*

## Addition of Decimals.

7

*Case 1.* If your Decimals be terminate, place Units under Units, Tens under Tens, &c. in whole Numbers, and annex the Decimals in order towards the Right Hand; then add them, and cut off from the Sum to the Right Hand so many Places for Decimals as are equal to the greatest Number of Decimal Places in any of the given added Numbers.

EXAMPLE I.	{	l.	56,7375					
			24,025					
Add together			20,0125					
			19,4875	{	l.	s.	d.	gr.
			12,05		25,	---	---	2,4
					31,	6	2	1,0
The Sum			132,3125		132	6	3	0

	{	l. Troy.	457,825					
			570,065625					
EXAMPLE II.			24,5375					
Add together			806,253125	{	l.	oz.	part.	gr.
			0,003125		43	---	---	1-0,768
			695,05		73	8	15	4,8
The Sum			2553,734375		2553	8	16	6

*Case 2.* If you have a great many several Sums to add, and their Decimals run to a great Number of Places, it will not be necessary to add them all, but only so many Places, as are sufficient to give the Value in the aggregated Sum, which will require but 4 or 5 Places, or 6 at most; for so far only the largest Tables go.

Observe to make that Figure (at which you break off) more by a Unit, if the next rejected Figure be more than 5; but if the next Figure be less than 5, reject the Figures only.

Then add the several Sums, and the certain Places of the Decimal are generally fewer by one than the Decimal Places retained in any of the given Sums. I shall subjoin an Example at large, and the same thus contracted.

EXAMPLE

## EXAMPLE.

$$\begin{array}{r}
 47.982774354 \\
 175.6732956 \\
 2.43752432 \\
 97.702006764 \\
 276.92301762 \\
 30.00420999 \\
 \hline
 630.722828648
 \end{array}
 \left. \begin{array}{l} \\ \\ \\ \\ \\ \\ \\ \end{array} \right\} \begin{array}{l} \text{Thus contracted} \\ \\ \\ \\ \\ \\ \\ \end{array}
 \begin{array}{r}
 47.98277 \\
 175.6733 \\
 2.43752 \\
 97.70201 \\
 276.92302 \\
 30.00421 \\
 \hline
 630.72283
 \end{array}$$

In this Example there are 4 Places of Decimals certain, or the same, in both Operations; and the Rule will scarce ever err *above an Unit* in the last Place. Now whatever you suppose the Integral Quantities to be, the *Tables* will shew you the Value of the Decimal Parts.

*Case 3.* Suppose the Numbers you are to add have *repeating Decimals*; if they are *single Repetends*, make them all *conterminous*, that is, end together; and then add as before, only to the last, or Right Hand Place of Decimals, add as many *Units* as there are *Nines* in it; and that *last Digit* shall be one of the *Repetends*.

*N. B.* It may be proper to give the first and last Places of all Repetends a *Dash* with the Pen, for Distinction.

## EXAMPLE I.

$$\begin{array}{r}
 l. \\
 124.2\cancel{3} \\

243.958733	,81 = 19 — 26,4
<u>Sum = 1242.812087</u>	<u>= 1242 — 19 — 29,2</u>

*Case 4.* If your Decimal be a *compound Repetend*, that is, consists of several Places of Figures which *continually repeat or return*; the Sum or Aggregate of any given Number of such Decimals will also *repeat*; and the Number of Places, or of the Figures, in each repetend, will be equal to the least *common Multiple* of those several Numbers which represent the Places of Figures in the Repetends added. Hence (tho' it be scarce ever necessary to have above five or six Places of Decimals, yet) if any one be minded to see the *Repetend complet*, he must observe this *Rule*;

From the Place where all the Repetends *begin together*, continue each Decimal to a Number of Places equal to the *Multiple aforesaid*; then add, and to the last Place add as many Units as there are 10's in the Place where the Repetends all begin together, and the Figures in those two Places are the *first* and the *last* of the *Repetend*. The Examples following will make all plain.

$$\begin{array}{r}
 \text{E X A M. I.} \left\{ \begin{array}{l} 13 \cdot 046x \\ 2 \cdot 804x \\ 5 \cdot 723x \end{array} \right. \begin{array}{l} l. \quad s. \quad d. \quad qr. \\ ,50 = -1-1,78 \\ ,37 = 7-1-3,2 \end{array} \\

		.49 = . — 17,64 .05 = 3— 0
		= 11—3—17,64

## C H A P. III.

## M U L T I P L I C A T I O N.

Case I. **I**F your Decimals be *complete* and *terminate*, whether they be *pure* or join'd with *Integers*. Multiply them as if they were all *whole Numbers*; and cut off (to the Right-Hand) so many Places for Decimal Parts in the Product as there were in both the *Multiplier* and *Multiplicand* counted together. But if it so happen that there are not so many Places in the Product, supply the Defect by prefixing Cyphers.

## E X A M P L E I.

Multiply	32.12	}	<i>Feet.</i>
by	24.3		
	9636		<i>Fq. Inq. Qr.</i>
	12848	}	,60 = . — 13,8
	6424		,51 = 73 — 7,04
Product	780,516		= 780 — 74 — 4,84

## E X A M P L E II.

Multiply	42,51	}	<i>Yards.</i>
by	,241		
	4251		<i>Yq. Fq. Inq.</i>
	17004	}	,99 = . — 12,84
	8502		,24 = 2 — 23,04
Product	10,24991		= 10 — 2 — 35,88

E X A M-

E X A M P L E III.

Multiply	78,546 Miles,				
by	436				
	471276			M. Fq. R. Y. F. In.	
	235638			{,60 = . — 1—5—0—1,8	
	314184			{,05 = . — 16—0—0—0	
Product	34246,056	=	34246—0—17—5—0—1,8		

E X A M P L E IV.

Multiply	,02365	}	of a Mile.		
by	,0435				
	11825			Mq. Aq. Rq. Pq.	
	7095			{,28 = . — . — 2,85	
	9460			{,10 = 0—2—22,4	
Product	,001028775	=	0—0—2—25,25		

*Case 2.* When it happens that the Places of Decimals run far in both Factors, and consequently would make a very large Decimal in the Product, you may contract your Work, in such a Case, to as few Places of Decimals in the Product as you please, or is suitable to your Design, by the following Rule, viz. set the Units Place of the *Multiplier* directly under that Figure of the Decimal Part of the *Multiplicand* whose Place you would preserve in the Product.

Then *invert*, or place all the other Figures of the *Multiplier* in a contrary order to the common way.

Lastly, in Multiplying always begin at the Figure of the *Multiplicand* which stands over the Figure wherewith you are then a Multiplying, setting down the *first Figure* of each particular Product *directly under one another*. But withal take care to see what *Increase* would arise from the Multiplying of the *two next Right-Hand Figures* of the *Multiplicand*, which you must constantly *add* to the *first Figure* in every Product.

## EXAMPLE I.

Suppose I would multiply 92.412031 Yards by 47.29195 Yards, and to have only *four Places* of Decimals in the Product.

Place them as before directed, and they will stand

Thus	{	92,412031	The Multiplicand as usual.
		59192,74	The Multiplier inverfed.
<hr style="width: 100%;"/>			
		36964812	
		6468842	
		184824	
		83171	
		924	
		832	
		46	
<hr style="width: 100%;"/>			
		4370,3451	

The Reason of, and how *great a part* of the Work is saved by, this *Contraction*, will appear from the *Operation at large*.

Thus	{	92,412031	
		59192,74	
<hr style="width: 100%;"/>			
	46	2050155	Hence it appears, that <i>half</i> the Work is uselefs, <i>viz.</i> all those Figures included in the <i>Square</i> , whose Sum make in- deed 7 places of Decimals, but are of <i>no value</i> , and there- fore superfluous.
	831	708279	
	924	12031	
	83170	8279	
	184824	062	
	6468842	17	
	36964812	4	
<hr style="width: 100%;"/>			
	4370,3451	4935045

E X A M P L E II.

Multiply 14,794, by 12,123; and to have thereby reserv'd two Places of Decimals in the Product, place them

Thus  $\left\{ \begin{array}{r} 14,794 \\ 321,21 \end{array} \right.$

$$\begin{array}{r} 14794 \\ 2959 \\ 148 \\ 30 \\ 4 \\ \hline 179,35 \end{array}$$

The common way  $\left\{ \begin{array}{r} 14,794 \\ 12,123 \end{array} \right.$

$$\begin{array}{r|l} 4 & 4382 \\ 29 & 588 \\ 147 & 94 \\ 2958 & 8 \\ \hline 14794 & \\ \hline 179,34 & 7662 \end{array}$$

E X A M P L E III.

Multiply 257,356 with 76,48, and for an Intire Product of Integers, place them as by the Rule

Thus  $\left\{ \begin{array}{r} 257,356 \\ 84,67 \end{array} \right.$

$$\begin{array}{r} 18015 \\ 1544 \\ 103 \\ 20 \\ \hline 19682 \end{array}$$

The same  $\left\{ \begin{array}{r} 257,356 \\ 7648 \end{array} \right.$

$$\begin{array}{r|l} 20 & 58848 \\ 102 & 9424 \\ 1544 & 136 \\ 18014 & 92 \\ \hline 19682, & 58688 \end{array}$$

From these Examples, tis manifest how advantageous these compendious Contractions are to facilitate and shorten the Work of those long and operous Calculations and Computations, which the experienced Practitioner finds occur but too often in Arithmetick, Algebra, and Geometry.

Case 3. If the Multiplicand be a Repetend only, and the Multiplier a single Digit, Multiply as usual; only observe to add in the last place of the Product as many Units as it contains Nines, and that place is a Repetend.

## Multiplication of Decimals. 21

If the *Multiplier* be a *Repetend*, multiply as usual; but in the *Product*, cut off one place less for Decimals than usual (which is all one as *multiplying by Ten*) and divide by Nine; continue the Quotient till it becomes a *Single* or *Compound Repetend*; and this shall be the *true Result* or *Answer*.

### EXAMPLE I.

$$\begin{array}{r}
 \text{Multiply } 724,35 \\
 \text{by } \quad \quad .08 \\
 \hline
 9)289,740 \\
 \hline
 \text{True Product } \quad 32,198
 \end{array}$$

### EXAMPLE II.

$$\begin{array}{r}
 \text{Multiply } 26,54 \\
 \text{by } \quad \quad .02 \\
 \hline
 9)7,963 \\
 \hline
 \text{True Product} = \quad 8849
 \end{array}$$

### EXAMPLE III.

$$\begin{array}{r}
 \text{Multiply } 251,43 \\
 \text{by } \quad \quad 8,78 \\
 \hline
 9)100,473 \\
 \hline
 111636 \\
 176001 \\
 201144 \\
 \hline
 \text{Product } \quad 2198,6046
 \end{array}$$

E X A M P L E

## Multiplication of Decimals.

### EXAMPLE IV.

$$\begin{array}{r}
 \text{Multiply } 48,754 \\
 \text{by } 2,13 \\
 \hline
 9)146263 \\
 \hline
 1625148 \\
 4875444 \\
 97508888 \\
 \hline
 \text{Product } 104,009,482
 \end{array}$$

*Case 4: If the Multiplicand be a Compound Repetend, and the Multiplier but a single Digit, Multiply as in Case the First; but observe to add to the Right-Hand Place of the Product so many Units as there are Tens in the Product of the Left-Hand Place of the Repetend. And the Product shall contain a Repetend whose Places are equal to those in the Multiplicand.*

### EXAMPLE I.

$$\begin{array}{r}
 \text{Multiply } 582,347 \\
 \text{by } 8 \\
 \hline
 \text{Product } 4658,778
 \end{array}$$

### EXAMPLE II.

$$\begin{array}{r}
 \text{Multiply } 592,378 \\
 \text{by } .03 \\
 \hline
 \text{Product } 17,77138
 \end{array}$$

### EXAMPLE III.

$$\begin{array}{r}
 \text{Multiply } 3749,23 \\
 \text{by } .007 \\
 \hline
 \text{Product } 26,24461
 \end{array}$$

## Multiplication of Decimals. 45

If the *Multiplier* consists of Places more than one, make all the several Products *conterminous* towards the *Right-Hand*, as taught in the *last Case*.

### EXAMPLE I.

$$\begin{array}{r}
 \text{Multiply} \quad 73,288 \\
 \text{by} \quad \underline{43,7} \\
 \hline
 5128x08 \\
 21977597 \\
 293134634 \\
 \hline
 \text{Product} \quad \underline{3202,40838}
 \end{array}$$

### EXAMPLE II.

$$\begin{array}{r}
 \text{Multiply} \quad 4027,3012 \\
 \text{by} \quad \underline{4370,2} \\
 \hline
 80546024 \\
 2819x108911 \\
 1208x9038190 \\
 1610920509205 \\
 \hline
 \text{Product} \quad \underline{17600112,02332}
 \end{array}$$

But if not *only* the *Multiplicand*, but the *Multiplier* also be a *Compound Repetend*, Multiply (as has been before taught,) each Figure of the *Repetend*, and add the several Products together; Then add the Result to it self in this Manner, set the first Left-Hand Figure so many Places forward as *exceeds* the Number of Places in the *Repetend* by one; and the Rest of the Figures in order after it; and thus proceed till the Result *last added* be carried *beyond the first*; Lastly, add these several Results together, beginning under the *Right-Hand Place* of the first, and from thence dash as many Figures for a *Repetend*, as the *Repetend* of the *Multiplier* does consist of.

E X A M.

*Multiplication of Decimals.***EXAMPLE I.**

$$\begin{array}{r}
 \text{Multiply } 235,01 \\
 \text{by } \underline{3,26} \\
 151006 \\
 67002 \\
 70503 \\
 \hline
 \text{First Product } 7871326 \\
 \phantom{\text{First Product }} 7871326 \\
 \phantom{\text{First Product }} 7871326 \\
 \hline
 \text{True Product } \underline{787,9209}
 \end{array}$$

**EXAMPLE II.**

$$\begin{array}{r}
 \text{Multiply } 432067 \\
 \text{by } \underline{,02436} \\
 2592402 \\
 1296201 \\
 1728268 \\
 884134 \\
 \hline
 \text{First Product } 1052515212 \\

 \phantom{\text{First Product }} 105 \text{ Gr.} \\
 \hline
 \text{True Product } \underline{10526,20474}
 \end{array}$$

**EXAMPLE III.**

$$\begin{array}{r}
 \text{Multiply } 42710,36 \\
 \text{by } \underline{,20402} \\
 12813108 \\
 17084144 \\
 8542072 \\
 \hline
 \text{First Product } 8714,1957508 \\
 \phantom{\text{First Product }} 87141957 \text{ Gr.} \\
 \phantom{\text{First Product }} 871 \text{ Gr.} \\
 \hline
 \text{True Product } \underline{8714,288936}
 \end{array}$$

*Multiplication of Decimals.* 25

If the *Multiplier* has any *terminate Places* join'd with the *Repetend*, and if the *Repetend* be *small* and these *many*, the best way will be to multiply and add the Products of the *Repetend* first; then after multiply by the *terminate Figures*, and add their Products to the *Sum* of the Product of the *Repetend*; and to this *last Result* add the said *Sum* of the *Repetend Products*, as in the last Examples.

E X A M P L E.

$$\begin{array}{r}
 \text{Multiply} \quad 432,43 \\
 \text{by} \quad \quad \quad 23,414 \\
 \hline
 \quad \quad \quad 172972 \\
 \quad \quad \quad 43243 \\
 \hline
 \end{array}$$

The Sum 605402 of the Product of the *Repetends*.

$$\begin{array}{r}
 172972 \\
 129729 \\
 86486 \\
 \hline
 1012491602 \\
 \quad \quad 605402 \\
 \quad \quad \quad 6054 \text{ Cr.} \\
 \quad \quad \quad \quad 60 \text{ Cr.} \\
 \hline
 10124,97717 \\
 \hline
 \end{array}$$

But if the *terminate Figures* are *few*, and the *Places* of the *Repetend* are *many*; the shortest way will be to *subtract* the *terminate Figures* from those of the *Repetend*, and multiply by the *Remainder* as a *Repetend*.

E

E X A M-

## C H A P. IV.

## DIVISION of DECIMALS.

**D**IVISION of Decimals is perform'd in the same manner as *Division of Integers*, both in regard of placing the Numbers, and the *Work* it self.

The *chiefest Difficulty*, in general, is to discover the *true Value* of the *Quotient Figures*, that is, how to separate *justly* the *Integers* and *Decimals* it contains. However the *Business of Valuing* the *Quotient* is render'd very plain and obvious, by a due *Observation* of either of the following *Rules*, viz.

*Rule I.* The *Quotient Figure* is always of the same *Value* with *that Figure* of the *Dividend*, under which the *Units Place* of its *Product* stands. Or thus,

*Rule II.* The *Decimal Parts* in the *Divisor* and *Quotient* must be always *equal in Number* to *those* of the *Dividend*.

Some Authors give *one* of these *Rules*, and some the other; but I have supplied you with both, that nothing may be wanting to render this *necessary* and *frequent Part* of the *Art* as *easy* and *ready* as possible.

From the second general *Rule* may be deduced these four *particular* and very *useful Directions*, viz.

1 *Direct.* When the *Decimal Places* in the *Divisor* and *Dividend* are equal, the *Quotient* will be whole Numbers.

2 *Direct.* When the *Places of Decimals* in the *Dividend* exceed those of the *Divisor*, the *Decimal Parts* in the *Quotient* must be equal to that *Excess*.

3 *Direct.* If the *Divisor* exceed the *Dividend* in *Decimal Places*, annex *Cyphers* to make them equal, then will the *Quotient* be *Integers*, by *Direct 1.*

4 *Direct.* If after you have finished *Division* and find not so many *Figures* in the *Quotient* as there ought to be *places of Decimal Parts* by the *general-Rule*, supply that *Defect* by prefixing *Cyphers* to the *Quotient*.

The *Learner* being thus fraught with *general Rules* and *particular Directions*; cannot, I think, without *Impeachment of his Ingenuity*, require any thing farther to be said or done

to make Division of Decimals evident and easy, except the Operations themselves in all the various Cases; to which I now proceed.

*Case 1.* When your Decimals are *complete* and *soon terminate*, place them and work as in *Whole Numbers*, having a strict regard to the Rules and Directions before given for *Valuing the Quotient*.

In *Division of Decimals* there may happen *Nine Varieties*, with respect to the Nature of the Numbers, which may be of *three Sorts*; viz.

First, *Integers*; or *Whole Numbers*.

Secondly, *Mixt*; consisting of *Integers* and *Decimals*.

Thirdly, *Pure Decimals*; without any *Whole Numbers*. Now the *Dividend* being it self of *three Kinds*, and capable of a *Divisor* of three kinds, there follows of consequence, these *nine Diversities*, viz.

Any *Whole Number* may be divided by a  $\left\{ \begin{array}{l} \textit{Whole Number.} \\ \textit{Mixt Number.} \\ \textit{Decimal.} \end{array} \right.$

A *Mixt Number* may be divided by a  $\left\{ \begin{array}{l} \textit{Whole Number.} \\ \textit{Mixt Number.} \\ \textit{Decimal.} \end{array} \right.$

A *Pure Decimal* may be divided by a  $\left\{ \begin{array}{l} \textit{Whole Number.} \\ \textit{Mixt Number.} \\ \textit{Decimal.} \end{array} \right.$

I shall explain and exemplify this by one Example, viz. by 1722 divided by 12 thus, at large.

$$12) 1722.0 \text{ (143.5)}$$

$$\begin{array}{r} 12 \\ \hline \cdot 52 \\ 48 \\ \hline \cdot 42 \\ 36 \\ \hline \cdot 60 \\ 60 \\ \hline \cdot \\ \cdot \end{array}$$

Here

## Division of Decimals.

Here you see the *Divisor* and *Dividend* are both *whole Numbers*; and because there was a Remainder of 6, I borrow a Cypher in order to divide it off clean, which gives (by *Direct* 2.) one Place, to wit, 5 in the Quotient for a Decimal. I shall subjoin this one Example varied according to all the Varieties aforesaid.

Variety	1—	— 12)1722.0	( 143,5	by <i>Direct</i> . 2.
	2—	— 12)172,20	( 14,5	by <i>Direct</i> . 2.
	3—	— 12),17220	(,01435	by <i>Direct</i> . 4.
	4—	— 1,2)1722.0	( 1435	by <i>Direct</i> . 1.
	5—	— 1,2)172,20	( 143,5	by <i>Direct</i> . 2.
	6—	— 1,2),17220	(,1435	by <i>Direct</i> . 2.
	7—	—,12)1722.00	(14350	by <i>Direct</i> . 3.
	8—	—,12)17,220	( 143,5	by <i>Direct</i> . 2.
	9—	—,12),17220	( 1,435	by <i>Direct</i> . 2.

But notwithstanding I have given a *Specimen* of all the Varieties in the last Example, and pointed to the *Direction*, by which each Quotient was form'd; yet 'twill be necessary to illustrate the *general Rule* by Examples wrought at large, wherein the *immediate Use* of the particular Directions will more *obviously* appear.

*Example 1.* Wherein the *Places of Decimal Parts* in the Divisor and Dividend are equal.

$$\begin{array}{r}
 8,45) 295,75 \text{ (35)} \\
 \underline{2535} \\
 \cdot 4225 \\
 \underline{4225} \\
 \dots
 \end{array}$$

$$\begin{array}{r}
 ,0074) ,4884 \text{ (66)} \\
 \underline{444} \\
 444 \\
 \underline{444} \\
 \dots
 \end{array}$$

Here because the *Decimals* in Divisor and Dividend are equal in Number, therefore the Quotients in both Instances are *whole Numbers*, by *Direct*. 1.

*Example*

## Division of Decimals.

31

*Example 2.* When the *Decimal Parts* of the Dividend exceed those of the Divisor.

$$\begin{array}{r}
 24,3) 780,516 (32,12 \\
 \underline{729} \\
 515 \\
 \underline{486} \\
 291 \\
 243 \\
 \underline{\phantom{243}} \\
 486 \\
 \underline{486} \\
 \dots
 \end{array}$$

$$\begin{array}{r}
 ,0067) ,3953 (,59 \\
 \underline{335} \\
 603 \\
 \underline{603} \\
 \dots
 \end{array}$$

In this Case the *Excess* is cut off in both the Quotients for *Decimal Parts*; by *Direct. 2.*

*Example 3.* When there are not so many Places of Parts in the Dividend as in the Divisor.

$$\begin{array}{r}
 7,684) 192,100 (25 \\
 \underline{.15368} \\
 38420 \\
 \underline{38420} \\
 \dots
 \end{array}$$

$$\begin{array}{r}
 ,7875) 441,0000 (560 \\
 \underline{39375} \\
 47250 \\
 \underline{47250} \\
 \dots
 \end{array}$$

Here *Cyphers* are annexed to the Dividend, to answer the *Decimal Places* of the Divisor, that the Quote might be whole Numbers; as in *Direct. 1.* by *Direct. 3.*

*Example 4.* When, after *Division is finished*, there are not so many Figures in the Quotient as there should be *Decimal Parts* by the *General Rule.*

$$\begin{array}{r}
 957) 7,25406 (,00758 \\
 \underline{6699} \\
 5550 \\
 \underline{4785} \\
 7656 \\
 \underline{7656} \\
 \dots
 \end{array}$$

$$\begin{array}{r}
 ,575) ,0007475 (,0013 \\
 \underline{575} \\
 1725 \\
 \underline{1725} \\
 \dots
 \end{array}$$

In

## Division of Decimals.

In both these Instances, by *Direction 4*, I prefix Cyphers to the Quotients, that together with those in the Divisors they might be equal to the Decimal Places of the Dividend.

If any *Whole, Mixt, or Decimal Number* is given to be divided by 10, 100, 1000, &c. you only remove the separating Point towards the Left-hand *so many Places* as there are *Cyphers in the Divisor*; as on the contrary in *Multiplication*, the *separating Point* is moved to the Right-hand *so many Places* as there are *Cyphers in the Multiplier*.

### E X A M P L E S *in*

<i>Multiplication.</i>	<i>Division.</i>
1,523 X 10 = 15,23	10)1523(152,3
1,523 X 100 = 152,3	100)1523(15,23
1,523 X 1000 = 1523	1000)1523(1,523
,0072 X 10 = ,072	10)72 (7,2
,0072 X 100 = ,72	100)72 (,72
,0072 X 1000 = 7,2	1000)72 (,072
,0072 X 10000 = 72	10000)72 (,0072

I shall next give a *Method* whereby you may work any Case of *Division by Multiplication*, and *vice versa*, any Case of *Multiplication by Division*; and this, in many Instances, will be found very excellent and useful.

### P R O B L E M I.

Suppose I have any Number, 7315, to *multiply* by any other Number 125; but yet have a mind to *divide* the said Number, and to have a Quotient equal to the Product of those two Numbers; *Quere* the Divisor?

*Rule.* Divide a *Unit* with *Cyphers annexed* by the given *Multiplier*, and the *Quotient* is the *Divisor sought*.

### E X A M P L E.

Given Multiplier 125) 1.000 (,008 = the Divisor sought.

1000

...

Then

## Division of Decimals.

33

Then {	Multiply	7315	,008) 7315,000	(914375
	by	125		
		36575		72
		14630		11
		7315		8
		914375		35
				32
				30
				24
				60
				56
				40
				40
				..

Thus I have obtain'd a Quotient *the same* as the Product.  
*Q. E. I.*

### P R O B L E M I I

Suppose I have any Number 7315 to be *divided* by any other Number ,008; but would *multiply* the said Number, and have a *Product* equal to the *Quotient* of the same Number divided by ,008; *Quere the Multiplier?*

*Rule.* Divide an *Unit*, with *Cyphers annexed*, by the *given Divisor*, and the *Quotient* will be the *Multiplier sought*.

,008) 1000	(125 = the Multiplier sought.
8	
20	
16	
40	
40	
..	

Thus you see this; and the Remainder of the Work, is only the Reverse of the former; and therefore need not be repeated.

*Case 2.* If your *Divisor* consist of *many Places* of *Decimal Parts*, the *Work* may be very much *contracted*, and yet a *just Quotient* obtained by the following *Rule*. Having determin'd the *Value* of the *Quotient Figures*, proceed in *multiplying the Divisor* with the first *Quotient Figure* as usual; but for *every Figure after*, in *multiplying*, *omit or prick off one* in the *Divisor*; still having a due regard to the *Increase*, which would arise from the *Figure* and *Figures so omitted*.

## E X A M P L E S.

*Contracted.*

$$\begin{array}{r}
 7,9863 \overline{) 70,2300} \quad (8,7938 \\
 \dots \quad 638904 \\
 \hline
 \cdot 63396 \\
 55904 \\
 \hline
 \cdot 7492 \\
 7187 \\
 \hline
 \cdot 305 \\
 239 \\
 \hline
 \cdot 66 \\
 63 \\
 \hline
 \cdot 3
 \end{array}$$

*At large.*

$$\begin{array}{r}
 7,9863 \overline{) 70,2300} \quad (8,7938 \\
 \quad \quad 638904 \\
 \hline
 \quad \quad 63396 \quad 0 \\
 \quad \quad 55904 \quad 1 \\
 \hline
 \quad \quad 7491 \quad 90 \\
 \quad \quad 7187 \quad 67 \\
 \hline
 \quad \quad 304 \quad 230 \\
 \quad \quad 239 \quad 589 \\
 \hline
 \quad \quad 64 \quad 6410 \\
 \quad \quad 63 \quad 8904 \\
 \hline
 \quad \quad 0 \quad 7506
 \end{array}$$

Tho' much Labour be this way saved, yet it is not proper to use it unless the *Decimals* in the *Quotient* be sure to four or six *Places*; since 'tis obvious, the next *Place*, or all the *Remainder* of the *Quotient* in the *contracted Work* would be three times more or greater than the same in the *Work at large*.

If the *Dividend* contain *many Places of Decimals*, there's no occasion for using but a *very few of the first*, as appears by this second *Example*.

E X A M-

EXAMPLE II.

$$\begin{array}{r|l}
 3,141592) 165,6995 & 001296 \text{ (52,7438)} \\
 \dots\dots\dots & \dots\dots\dots \\
 \hline
 & 1570796 \\
 \hline
 & 86199 \quad \dots \\
 & 62831 \quad \dots \\
 \hline
 & 23368 \quad \dots \\
 & 21991 \quad \dots \\
 \hline
 & 1377 \quad \dots\dots \\
 & 1256 \quad \dots\dots \\
 \hline
 & 121 \quad \dots\dots \\
 & 94 \quad \dots\dots \\
 \hline
 & 27 \quad \dots\dots \\
 & 25 \quad \dots\dots \\
 \hline
 & 2 \quad \dots\dots
 \end{array}$$

Here you may observe, that of *Ten Decimal Places* in the Dividend, I have used only *Four*; and yet have a Quotient to *four Places* of Decimals true: Hence all the Figures which would have fill'd the *dotted Space*, had it been work'd at large, are *superfluous*; and those, tis evident, make *half* the Work.

*Case 3.* If your *Dividend* contain a *single Repetend*, and your *Divisor* be a *single terminate Digit*, divide as usual; and when you take down your *Repetend*, the Quotient will *begin to repeat*.

EXAMPLE

$$\begin{array}{r}
 4) 195,0\dot{2} \text{ (48,7\dot{2})} \\
 \underline{16} \\
 35 \\
 \underline{32} \\
 30 \\
 \underline{28} \\
 22 \\
 \underline{20} \\
 2
 \end{array}$$

} *Ad Infinitum.*

EXAMPLE II.

$$\begin{array}{r}
 6) 3176,\dot{0} \text{ (529\dot{3})} \\
 \underline{30} \\
 17 \\
 \underline{12} \\
 56 \\
 \underline{54} \\
 20 \\
 \underline{18} \\
 2
 \end{array}$$

} *Ad Infinitum.*

## Division of Decimals.

If the *Divisor* be any Number of *terminate Digits*, the *Quotient* will repeat a *single Digit*; but not always *begin*, when the *Repetend* is taken down.

E X A M. III.

48)79,20(165,138

Other-

## Division of Decimals.

57

Otherwise thus; place the Dividend *under it self*, but *one Place forward to the Right-hand*; and then subtract, the Remainder will be the new Dividend, the same as before.

The Dividend	572,40	as before.
The same placed	5724	one Figure forwards.
Remains a new	575,16	Dividend as before.

From hence also appears the Reason of cutting off one more Figure in the new Dividend for Decimals.

That either of these Ways will give the same Quotient you have seen, and that the Quotient this way produced is the only true one will appear from the Work of the last Example at large.

8,)	572,4	0000 Sc.	(642,05	
	5333	3333 Sc.		
	390	0666 Sc.		
	385	5555 Sc.		
	35	1111 Sc.		
	34	6666 Sc.		
	8	4444 Sc.		
	8	0000 Sc.		
	.	4444 Sc.		

In this Operation, tis manifest though the *Repetends* in every particular Step would proceed to *Infinity*, yet in the last Place you see there is an *infinite Product* equal to an *infinite Remainder*; and consequently the Work must there cease, and the Quotient nevertheless be true.

If the *Divisor* consists of *terminate Numbers* join'd to the *Repetend*, and the *Dividend* be *complete*; proceed thus: Subtract the *terminate Numbers* of the *Divisor* from the *Divisor* it self, and the *Remainder* shall be a *new Divisor*; and deal with the *Dividend* as in the last Example, for a *new Dividend*.

E X A M-

## EXAMPLE VI.

Suppose it required to divide 8569,88 by 4,88; Work as follows;

$$\begin{array}{r}
 4,88 \overline{) 8569,88} \quad (1760,9 \text{ the Quotient if work'd at large.} \\
 \underline{48} \quad 856988 \\
 4,38 \overline{) 7712,892} \quad (1760,9 \text{ the same.} \\
 \underline{438} \\
 3332 \\
 \underline{3066} \\
 2668 \\
 \underline{2628} \\
 \dots 4092 \\
 \underline{3942} \\
 50
 \end{array}$$

If the *Divisor* and *Dividend* do each contain a *Repetend*, order them as before directed; and the *Quotient* will be either *terminate*, *repeat a single Digit*, or else a *compound Repetend*.

## EXAMPLE VII.

Divide 134,28 by ,6

$$\begin{array}{r}
 \underline{13428} \\
 ,6 \overline{) 120,84} \quad (201,4 \text{ the true Quotient.} \\
 \underline{12} \\
 \dots 08 \\
 \underline{6} \\
 24 \\
 \underline{24} \\
 \dots
 \end{array}$$

 \end{array}$$

} *Ad Infinitum.*

In *Division* it may often happen that the *Quotient* may not *repeat* so soon as is desired; in such Case the Value of the *Quotient* may be expressed compleatly by a *Vulgar Fraction*.  
But

But in order to understand this, 'twill be necessary to premise the following *Lemma's*.

*Lemma 1.*

A *Series* of Nines infinitely continued, is equal to *Unity*, or One, in the next Left-hand Place; thus 0,999, &c. is equal to 1; and ,0999 &c. = ,1; and ,00999 &c. = ,01; and 549,99 &c. = 55.

*Demonstration.* 'Tis evident that ,9 =  $\frac{9}{10}$  wants, only  $\frac{1}{10}$  of *Unity*; and ,99 wants  $\frac{1}{100}$ ; ,999 wants  $\frac{1}{1000}$  of *Unity*; so that if the *Series* were continued to *Infinity*, the *Difference* between that *Series* of Nines and an *Unit*, would be equal to *Unity* divided by *Infinity*, that is, *Nothing* at all. Q. E. D.

*Lemma 2.*

Any single *Repetend* multiplied by 10, and then subtracted from that *Product*; the *Remainder* will be the same *Number* complete or terminate, in the next superior Left-hand Place.

*Demonstration.* Let the given *Repetend* be ,6666, &c, this multiplied by 10 is 6,666 &c.

From which Subtract ,666 &c.

There will remain 6, . . . a whole *Number*.

Thus 47,77 &c. will become 430. and ,0333 &c. will be ,3. Q. E. D.

*Corollary 1.*

Hence it follows that if any *Compound Repetend* be multiplied by an *Unit* with so many *Cyphers* annexed as are equal to the *Places* of the *Repetend*, and then subtracted from the *Product*, there will be left to the Left-hand the same *Numbers* terminate and complete, that constituted the *Repetend*; thus, 325 multiplied by 1000, will be 325,325 from which if you subtract ,325 there will remain the terminate *Number* 325; Thus 12,743 will be 12731; and ,000743 will be ,743, and 5275,3 will become 5270,1.

*Corollary 2.*

Hence also if any *Repetend* be multiplied by so many *Nines* as it contains *Places*, the *Result* will be the same as before;

## Division of Decimals.

43

The Reason why the Quotient is thus expressed will be evident if we consider.

First, That 314 is not the *entire* Remainder because the Dividend is a *Repetend*, perpetually supplying a *circulating Remainder*, which expressed in its proper Terms would be, where we leave off, wrote thus 31426586. But this *Infinite Series* of Figures is truly expressed thus, 314  $\frac{26586}{99999}$  by *Corol. 3.*

Secondly, It being plain that 314  $\frac{26586}{99999}$  is the true Remainder, and 417,2 the Divisor, 'tis necessary they should be expressed in the Quotient as here you see them by the Rules of *common Division*.

If instead of 314  $\frac{26586}{99999}$  you write its *Equivalent* 31426586, and from it subtract the *terminate* part 314, there will remain 31426272 a new Numerator. And if to 417,2 you *add* as many *Cyphers* as the *Repetend* consists of Places, thus 417,200000; and again subtract it, as a *terminate* part, there will remain 417195828 for a new *Denominator*; and then this new and more *simple Fraction*  $\frac{31426272}{417195828}$  will be equal to *that* in the *Quotient*.

The *Reason* of reducing the *Fraction* of the Quotient in this Manner is obvious from *Corol. 1. of Lem. 2.*

$$\begin{array}{r} \text{For } 31426586 \times 100000 = 3142658626586 \text{ Sc.} \\ \text{From which subtract it self} \quad \underline{31426586} \text{ Sc.} \end{array}$$

.....

And there will remain the new Numerator 31426272 as before:

$$\begin{array}{r} \text{Then } 417,2 \times 100000 = 417,200000 \\ \text{From which subtract it self} \quad \underline{4172} \end{array}$$

There remains the Denominator 417195828 as before.

Thus I have supplied you with Rules for managing the *whole Doctrine of Circulating Numbers*; and given the *Theory* and *Reasons* for the same; which you may search for in vain in any other Book (that I know of) so fully as here laid down.

C H A P.

## C H A P. V.

## REDUCTION of DECIMALS:

**I**T being sufficiently experienced that all *Arithmetical Operations* are with the greatest *Facility* and *Expedition* work'd in *whole Numbers*; that *Vulgar Fractions*, and *Numbers of diverse Denominations* in their Management require *great Art*, and are attended with *much Perplexity*; and that the *noble Art of Decimal Arithmetick* alone is susceptible of all the various kinds of *Numbers*, and at the same time hath all its *Operations* perform'd by the same *easy* and *common Rule*, and in the very *same* manner of *Integral Quantities*, or *whole Numbers*; This, I say, being well known to all versed in the *Science of Numbers*, hath justly rendered *Decimal Arithmetick* in the *greatest Esteem* among those who *understand* it; and is most *generally used* by them in almost all kinds of *Numerical Calculations*.

The Part we now treat of is *absolutely necessary* to the *true Understanding* and *Use* of this *excellent Art*; and teaches, *First*, To *reduce* or *express* any *Vulgar Fraction* in *Decimal Parts* of the *Integral Quantity*.

*Secondly*, To *reduce* such *Numbers* as consist of various *Parts* and *Denominations*, as those of *Money*, *Weight*, *Measure*, &c. into *Decimals* for more *easy Operation*.

*Thirdly*, To *reduce* *Decimal Parts* into the *common* and *known* *Parts of Money, Measure, &c.*

*Case 1.* To *reduce* *Vulgar Fractions* into *Decimals*, the *common Rule* is, to *divide* the *Numerator* by the *Denominator*, and the *Quotient* will be the *Decimal required*; that is, *equivalent* to the *Vulgar Fraction* given.

## E X A M P L E I.

What is the *Decimal equivalent* to the *Fraction*  $\frac{3}{4}$ ?

4) 3,00 (,75 The *Decimal required*.

$$\begin{array}{r} 28 \\ \hline \cdot 20 \\ 20 \\ \hline \cdot\cdot \end{array}$$

E X.

**EXAMPLE II.**

Reduce  $\frac{1}{4}$  of a Pound into *Decimal Parts* of a Pound:

8) 3,000 ( 375 = 7 : 6 the Answer.

$$\begin{array}{r} 24 \\ \hline \cdot 60 \\ 56 \\ \hline 40 \\ 40 \\ \hline \dots \end{array}$$

**EXAMPLE III.**

Reduce  $\frac{1}{12}$  of a Pound Troy into *Decimal Parts*.

16) 3,000 ( 1875 = 2 : 5 the Answer.

$$\begin{array}{r} 16 \\ \hline 140 \\ 128 \\ \hline 120 \\ 112 \\ \hline \cdot 80 \\ 80 \\ \hline \dots \end{array}$$

**EXAMPLE IV.**

Reduce  $\frac{1}{17}$  of a Rod into *Decimals*.

27) 4,000 ( 148 = 2 : 5 : 1 Answer.

$$\begin{array}{r} 27 \\ \hline 130 \\ 108 \\ \hline 220 \\ 216 \\ \hline \cdot 4 \end{array} \left. \vphantom{\begin{array}{r} 27 \\ \hline 130 \\ 108 \\ \hline 220 \\ 216 \\ \hline \cdot 4 \end{array}} \right\} \textit{Ad Infinitum.}$$

**EXAM.**

48 *Reduction, &c. into Decimal, &c.*

EXAMPLE V.

Reduce  $5\frac{1}{8}$  of a Hoghead into Decimals  
Gal. Pts.

27) 11,000 (407 ~~27~~ : 5

108

.. 200  
189

11

} *Ad Infinitum.*

*H. Gal. Pints.*

Hence the Answer is  $5,407 = 5 : 25 : 5.$

*Reduction of Vulgar Fractions into Decimals* is also com-  
modiously perform'd by *Logarithms*, especially when the  
*Fraction is large*; thus, subtract the *Logarithm* of the *De-*  
*nominator* from the *Logarithm* of the *Numerator*, the *Re-*  
*mainder* is the *Logarithm* of the *Decimal Part*.

EXAMPLE I. By *Logarithms*.

Reduce the Fraction  $\frac{127}{4123}$  into *Decimal Parts*.

Thus, the *Logarithm* of 127 is ——— 2.1038037  
the *Logarithm* of 4123 subtract, — 3.6152133

Remains the *Logarithm* or the *Decim.*  $.4908 = 8.4885904$

EXAMPLE II.

What is the *Decimal* of the *mix'd Fraction*  $5\frac{91}{3479}$

From the *Logarithm* of the *Numerator* 91 1.9590414  
Subtract the *Logarithm* of the *Denominator* 3.5414544

There Remains the *Log.* of the *Dec.*  $.026557 = 8.4175870$

To which prefix the *integral Quantity* 5, and the Answer  
will be complet, thus 5.026157.

The same thing might as well have been done by reducing  
the *mixt Fraction* into an *improper one*, viz.  $\frac{17486}{3479}$

Then,

Then, as in the first Example.

From the Log. of the Numerator 17486 — 4.2426904  
 Subtract the Log. of the Denominator 3479 — 3.5414544

Remains the Log. of the Answer 5,026157 — 0.7012360

*Note*, In the first and second Examples, and in all such Cases where you subtract a *greater* Index from a *less*, you borrow *Tens* and as *many Digits* as the *remaining Index* want; of *Nine*, so *many Cyphers* prefix to the *Decimal*.

*Case 2.* To reduce Numbers which express Quantities of various Kinds and Denominations, as *Money, Measure, &c.* into *Decimals*, there are *three Ways* or *Methods*, which are as follows.

*Method 1.* Reduce the *different Species* to *one*; that is, to the lowest Denomination they consist of: then reduce the *Integer* to the *same Denomination*; the *first* will be the *Numerator*, the *latter* the *Denominator* of a *Vulgar Fraction*; which Fraction reduced to a *Decimal* (by *Case 1.*) will be *that* required.

E X A M P L E I.

What Decimal Part of a Pound is 5 s. 7 d.  $\frac{3}{4}$ ?

	s.		l.
Multiply	5	Then reduce	1 the Integer.
By 12 d.	<u>12</u>		<u>20</u>
	60		<u>20</u>
Add the 7 d.	<u>7</u>		<u>12</u>
	67 Pence.		<u>240</u>
Mul. by 4 q	<u>4</u>		<u>4</u>
	268		960 Farthings in a Pound.
Add the 3 q	<u>3</u>		
	271 Farthings.		

That is  $\left\{ \begin{array}{l} 271 \text{ the Numerator} \\ 960 \text{ the Denominator} \end{array} \right\}$  of the Vulgar Fraction.

Then 960) 271,0000 (28229  $\frac{3}{4}$ . The Answer.

150 *Reduction of different Denominations,*

So that .28229 is the *Decimal Part* of a Pound in one Denomination, equal to 5 s. 7 d. 4, the Part of a Pound in *diverse Denominations.*

EXAMPLE II.

What *Decimal Part* of a *Hundred Weight* is 2 q. 21 lb. 12 oz.?

Q. lb. oz.	C.
Reduce 2 : 21 : 12 to Ounces.	And 1 reduce to Ounces.
$\begin{array}{r} 28 \\ \hline 77 \\ 16 \\ \hline 494 \\ 78 \\ \hline 1344 \end{array}$ Ounces	$\begin{array}{r} 4 \\ \hline 4 \\ 28 \\ \hline 112 \\ 16 \\ \hline 1792 \end{array}$ Ounces in C.W.

Then  $\left\{ \frac{1244}{1792} \right\}$  is the *Vulgar Fraction.*

And 1792) 1244,0 (=,694196 the *Decimal Part* of an *Hundred Weight* (answering to 2 q. : 21 lb. : 12 oz. required.

EXAMPLE III.

What *Decimal Part* of a *Rod* or *Pole*, is 4 Y. : 2 F. : 8 In.?

Y. F. In.	1 Pole.
4 : 2 : 8	
$\begin{array}{r} 3 \\ \hline 14 \\ 12 \\ \hline 176 \end{array}$ Inches.	$\begin{array}{r} 55 \\ \hline 55 \\ 3 \\ \hline 165 \\ 12 \\ \hline 1980 \end{array}$ Inches in a Pole.

But  $\frac{176}{198} = \frac{88}{99} = .8$  the (repeating) *Decimal* of a *Pole*, equal to the 4 *Yards*, 2 *Feet*, and 8 *Inches.*

In the *same Manner* proceed with any other given *Species.*  
*Method*

## *into Decimal Parts of the Integer.* 54

*Method 2.* Find what *Decimal Part* the *least* Denomination of the given *Species*, is of the next *superior*, to which prefix the given Part of the next superior Denomination; then see what *Decimal Part* this *mixt Number* is of the next *superior* Denomination, to which again prefix what is *given* of it; and thus proceed till you ascend to the *Integer*, if self, and find what *Decimal Part* of it the last *mixt Number* is, which will be that sought.

### E X A M P L E I.

What *Decimal Part* of a *Round* is 12 s. 6 d.  $\frac{1}{4}$  ?  
 First 4) 2,0 (,5 the *Decimal* of one Penny for  $\frac{1}{4}$ .  
 Secondly 12) 6,5 (,5416 the *Dec. Part* of a Shill. for 6d.  $\frac{1}{4}$ .  
 Thirdly 20) 12,5416 (,627083 the *Decimal Part* of a Pound, as was required, for 12s. 6d.  $\frac{1}{4}$ .

### E X A M P L E II.

What *Decimal* of a Pound Troy is 2 oz. 18 pwt. 20 gr. ?  
 First 24) 20,000 (.875 the *Decimal* for 20 gr.  
 Secondly 20) 18,875 (.94375 the *Decimal* for 18 pwt. 20 gr.  
 Thirdly, 12) 2,94375 (.2453125 the *Decimal Part* of a Pound Troy for 2 oz. 18 pwt. 20 gr. as was required.

### E X A M P L E III.

What *Decimal Part* of a Year is 6 m. 3 w. 5 d. 6 h. 40' 50" ?

First 60) 50,00 (.83 Decimals for 50" of 1'.  
 Secondly 60) 40,83 (.6808 Dec. for 40' : 50" of an Hour.  
 Thirdly, 24) 6,6808 (.2783148 = 6 H. 40' : 50" of a Day.  
 Fourthly, 7) 5,2783148 (.75404 Sc. Decimals of a Week.  
 Fifthly, 4) 3,75404 Sc. (.93851 Decimals of a Month.  
 Sixthly, 12) 6,93851 (.53373 Decimals of a Year.

So that we see the *six* different Parts of Time above specified are reduced to this small *Decimal* ,53373; which expresseth the *same* Part of a Year as they do; which, by the way, may be an Instance of the great *Simplicity*, *Ease*, and *Excellency* of this *admirable Art*.

In these three Examples I have omitted the Work at large, setting down only the *Divisors*, *Dividends*, and *Quotients* as

52 *Reduction to Decimals by Tables.*

sufficient to give the *Learner* as good a Notion of the Method as the Operations at length, which he may make his *Exercise at pleasure* to good advantage.

*Method 3.* The *third Method* for finding the *Decimal* of any given *Part* of Quantity consisting of *diverse Denominations*, is by *Tables* ready calculated for that purpose.

This is not only the most *easy*, but the most *expeditious* Manner of working the Processes of *all Kind* of Computations in general; and is of particular service in this Case of *comparing Numbers* for *Decimal Operations*.

For that reason I have here inserted a *Set of Tables*, which, tho' some are *common* of this kind, are the most *complete* and *universal* of any I have seen extant; and in order to render them so, I have not only very much *enlarged* and *new vamped* the old ones, but also *added* other very useful ones; as those who are read in these Matters, will soon perceive.

By the *following Tables*, all the *Species of Money, Weight, Measure, &c.* consisting of *what ever* Denomination, and be the *Integer* what you please, are immediately turn'd into *Decimal Parts*; and are then work'd with the known *Facility* and *Pleasure* of Whole Numbers.

As to the *manner of using* those *Tables*, that is so *obvious and natural*, even by a *bare Inspection*, that I presume tis needless to say any thing to a Person of *Genius*, though a *Learner*, about that. The *Scheme of Examples* following being sufficient to testify the great *Use* and *Excellency* of such *Tables*, and are both *Precedents* and *Precepts* themselves.

E X A M P L E I.

What is the *Decimal Part* of a *Pound* for 13 s. 7 d.  $\frac{1}{2}$ ?

In <i>Table I.</i> you	{	13 Shillings	— —	,65
find answering to	}	7 Pence	— —	,0322916
		3 Farthings	}	— —

The Answer is — — — — ,6822916

E X A M P L E II.

What *Decimal Part* of a *Mark* is 11 s. 2 d.  $\frac{1}{2}$ ?

In <i>Table I.</i> un-	{	11 Shillings	— —	,65
der a <i>Mark</i> , against	}	2 Pence	— —	,0125
		2 Farthings	— —	,003125

The Answer — — — — ,840625

E X A M-

E X A M P L E III.

What *Decimal Part* of a *Moidore* is 9 s. 3 d.  $\frac{1}{4}$ ?

In Table I. under Moidore you find against	{	9 Shillings	—	—	,	233333
		3 Pence	—	—	,	008289
		1 Farthing	—	—	,	000771

The Answer is this *compound Repetend* 343363992

E X A M P L E IV.

What *Decimal* of a *Pound Troy* answers to 5 oz. 17 *pwts.* 22 *gr.*?

In Table II. you find against	{	5 Ounces	—	—	,	418666
		17 Penny Weight	—	—	,	070883
		22 Grains	—	—	,	003819

The *Sum* of which is the Answer 491319

E X A M P L E V.

What *Decimal Part* of an *Hundred Weight* is 21 *lb.* 14 *oz.*?

In Table III. you find against	{	21 Pounds	—	—	,	1875
		14 Ounces	—	—	,	007812

The Answer is 195312

E X A M P L E VI.

What *Decimal Part* of a *Tun* is 3 *qr.* 6 *bush.* 7 *gall.*?

In Table V. Dry Measure, against	{	3 Quarters	—	—	,	6
		6 Bushels	—	—	,	15
		7 Gallons	—	—	,	021875

The Answer is 771875

E X A M P L E VII.

What *Decimal Part* of a *Hogshead* of Wine, is 2  $\frac{1}{2}$  *Rund.* 14 *Gall.*?

In Table VI. Liquid Measure, you find against	{	2 $\frac{1}{2}$ Rundlets	,	71425
		14 Gallons	,	22222 <i>Sc.</i>

The Answer (*repeating a single Figure* is 936472 *Sc.*

E X A M.

**E X A M P L E VIII.**

How is 27 Miles, 7 Furlongs, 25 Rods, and 4 Yards expressed in Decimals?

In Table VIII. Long Measure (one Mile the Integer) you find against	}	7 Furlongs	—	,875
		25 Rods, or Poles,	—	,109375
		4 Yards	—	,002272

The 27 Miles prefixed, the Answer will be 27,986647

**E X A M P L E IX.**

What Decimal Part of a Year is 7 Months, 3 Weeks, and 2 Days?

In Table IX. you observe against	}	7 Months.	—	,538461
		3 Weeks.	—	,097630
		2 Days	—	,005494

The Answer is ,601585

**E X A M P L E X.**

What Decimal Part of a Sign of the Zodiac is 25° 46' 8"?

In Table X. you find against	}	25 Degrees	—	,8233333
		46 Minutes	—	,0255555
		8 Seconds	—	,000073

The Answer is a *single Repetend* — ,8589618

**E X A M P L E XI.**

What Decimal Part of a Degree, is 49' 57"?

In the same Table you see against	}	49 Minutes	—	,816666
		57 Seconds	—	,015833

The Answer is — ,8325

Having thus so largely exemplified the Use of the Tables, the Tables themselves follow; wherein observe, 1. I have dash'd the first Figure of all *single Repetends*, and the first and last of the *compound Repetends* that come within the Table. 2. I have nevertheless continued each to six Places for their sakes who would be exact, but know not well how to manage *Repetends*.

## Common Tables of Money, Weights, Measures, and Time.

Table I. Money.

*Farth.*

$$\begin{aligned} 4 &= 1 \text{ Penny.} \\ 48 &= 12 = 1 \text{ Shilling.} \\ 960 &= 240 = 20 = 1 \text{ Pound.} \end{aligned}$$

Table II. Apothecaries Weight.

*Grains.*

$$\begin{aligned} 20 &= 1 \text{ Scruple.} \\ 60 &= 3 = 1 \text{ Dram.} \\ 480 &= 24 = 8 = 1 \text{ Ounce.} \\ 5760 &= 288 = 96 = 12 = 1 \text{ lb.} \end{aligned}$$

Table III. Troy Weight.

*Grains.*

$$\begin{aligned} 24 &= 1 \text{ Penny Weight.} \\ 480 &= 20 = 1 \text{ Ounce.} \\ 7560 &= 240 = 12 = 1 \text{ lb.} \end{aligned}$$

Table IV. Moneyers Weight.

*Blanks.*

$$\begin{aligned} 24 &= 1 \text{ Periot.} \\ 480 &= 20 = 1 \text{ Droite.} \\ 11520 &= 480 = 124 = 1 \text{ Mite.} \\ 230400 &= 9600 = 480 = 20 = 1 \text{ Grain.} \end{aligned}$$

Table V. Averdupois Weight.

*Drams.*

$$\begin{aligned} 16 &= 1 \text{ Ounce.} \\ 256 &= 16 = 1 \text{ Pound.} \\ 28872 &= 1792 = 112 = 1 \text{ Hundred.} \\ 573440 &= 35840 = 2240 = 20 = 1 \text{ Tun.} \end{aligned}$$

Table

Table VI. Wine Measure.

## Cubic In.

231	=	1	Gallon.
9702	=	42	= 1 Tonne.
14553	=	63	= 1½ = 1 Hogshead.
19404	=	84	= 2 = 1½ = 1 Punch.
29106	=	126	= 3 = 2 = 1½ = 1 Butt.
58212	=	252	= 6 = 4 = 3 = 2 = 1 Tun.

Table VII. Ale Measure.

## Cubic In.

282	=	1	Gallon.
2256	=	8	= 1 Firkin.
4512	=	16	= 2 = 1 Kilderkin.
9024	=	32	= 4 = 2 = 1 Barrel.
13536	=	48	= 6 = 3 = 1½ = 1 Hogshead.

Table VIII. Beer Measure.

## Cubic In.

282	=	1	Gallon.
2583	=	9	= 1 Firkin.
5076	=	18	= 2 = 1 Kilderkin.
10152	=	36	= 4 = 2 = 1 Barrel.
15228	=	54	= 6 = 3 = 1½ = 1 Hogshead.

Table IX. Dry Measure.

## Cubic In.

268.8	=	1	Gallon.
537.6	=	2	= 1 Peck.
2150.4	=	8	= 4 = 1 Bushel.
8601.6	=	32	= 16 = 4 = 1 Coomb.
17203.2	=	64	= 32 = 8 = 2 = 1 Quarter.
68812.8	=	256	= 128 = 32 = 8 = 4 = 1 Chalden.
86016.0	=	350	= 160 = 40 = 10 = 5 = 1 Wey, or Load.
172032.0	=	640	= 320 = 80 = 20 = 10 = 2 = 1 Last.

Table X. Of Time.

<i>Seconds.</i>			
60 =	1 Minute.		
3600 =	60 =	1 Hour.	
86400 =	1440 =	24 =	1 Day.
604800 =	10080 =	168 =	7 = 1 Week.
2419200 =	40320 =	672 =	28 = 4 = 1 Month.
31556937 =	525949 =	8765 =	365 = 52 = 13 + 1 Day, +
	5 Hours, +	48' +	57" = Year.

Table XI. Long Measure.

<i>Barly Corns.</i>			
3 =	1 Inch.		
36 =	12 =	1 =	Foot.
108 =	36 =	3 =	1 Yard.
594 =	198 =	16½ =	5½ = 1 Pole.
23760 =	7920 =	660 =	220 = 40 = 1 Furlong.
190080 =	63360 =	5280 =	1760 = 320 = 8 = 1 Mile.

Table XII. Square Measure.

<i>Square In.</i>			
144 =	1 Feet sq.		
1296 =	9 =	1 Yards sq.	
3600 =	25 =	2,7 =	1 Paces sq.
39204 =	3724 =	304 =	10,2 = 1 Poles sq.
1568160 =	10890 =	1210 =	435,6 = 40 = 1 Rood sq.
6272640 =	43560 =	4840 =	1742½ = 160 = 4 = 1 Acres sq.

Table XIII. Scripture Measure.

<i>Digits.</i>			
4 =	1 Palm.		
12 =	3 =	1 Span.	
24 =	6 =	2 =	1 Cubit.
96 =	24 =	8 =	4 = 1 Fathom.
144 =	36 =	12 =	6 = 1; = 1 Ezekiels Reed.
192 =	48 =	16 =	8 = 2 = 1; = 1 Arabian Pole.
1920 =	480 =	160 =	80 = 20 = 13; = 10 = 1 Schœnus or mea-
			asuring Line.

Table IV. Eastern Measure.

Cubits.

400	=	1	Stadium.
2000	=	5	= 1 Sabbath Days Journey.
4000	=	10	= 2 = 1 Eastern Miles.
12000	=	30	= 6 = 3 = 1 Parasang.
96000	=	240	= 48 = 24 = 8 = 1 Days Journey.

Table XV. Hebrew Measure.

Gachal.

20	=	1	Cab.
36	=	1 $\frac{1}{2}$	= 1 Omer.
120	=	6	= 3 $\frac{1}{2}$ = 1 Seab.
360	=	18	= 10 = 3 = 1 Epha.
1800	=	90	= 50 = 15 = 5 = 1 Letheck.
3600	=	180	= 100 = 30 = 10 = 2 = 1 Homer, or Coron.

Table XVI. Hebrew Measure.

Eaph.

1 $\frac{1}{2}$	=	1	Log.
5 $\frac{1}{2}$	=	4	= 1 Cab.
16	=	12	= 3 = 1 Hin.
32	=	24	= 6 = 2 = 1 Seab.
96	=	72	= 18 = 6 = 3 = 1 Bath Epha.
960	=	720	= 180 = 60 = 30 = 10 = 1 Coron Chomer.

Table XVII. Hebrew Money.

Gerahs.

10	=	1	Bekah.
20	=	2	= 1 Shekel.
1200	=	120	= 60 = 1 Maneh.
60000	=	6000	= 3000 = 50 = 1 Talent.

general Decimal Table.*

1. The Figures at *Top*, which run to 20, shew the *Number* of *Parts* any *Quantity* or *Integer* is *divided* into; and the Figures in the *side Column* are those *Parts* themselves; The Figures forming the *triangular Space*, and disposed into proper *Columns*, are the *Decimal Parts* of the *Integral* *Quantity* answering thereto. Hence any *Quantity* divided into any *Number* of *Parts* under 20, the *Decimals* answering to each of those *Parts* are seen in *one view* in their proper *Column*.

*Example.* Suppose a *Quantity* divided into *Eight equal Parts*, and you would know the *Decimal Part* equivalent to each: Look at top for 8, under which are disposed the *Decimals*, viz. ,125 ,25 ,375 &c. answering in order to the *Parts* in the *side Column*.

2. The Figures in the *side Column* may be taken for the *Numerator*, and those at top, for the *Denominator* of a *Vulgar Fraction*.

Then the *Decimal* corresponding to those *two Numbers* respectively, is equal to the forefaid *Fraction*: Thus the *Decimal* 5714 answering to 4 in the *side*, and 7 at *top*, is equal to the *Fraction*  $\frac{4}{7}$ . So  $\frac{9}{13} = ,6922$ .  $\frac{5}{6} = ,8\bar{3}$ .  $\frac{6}{11} = ,54$ .

$$\frac{13}{16} = ,8125. \quad \frac{16}{19} = ,8418. \quad \frac{17}{20} = ,85 \text{ \&c.}$$

Also any *larger Fraction* whose *Parts* are an *Equimultiple* of any of these *tabular Fractions*, or may be reduced to them, are equally answer'd in *Decimals* by this *Table*; see

this *Example*  $\frac{588}{1512} = \frac{84}{210} = \frac{21}{54} = \frac{7}{18} = ,38$  *Decimals* in the *Table*.

*Case* 3. To reduce any *Decimal* into the equivalent known *Parts* of *Coin*, *Weights*, *Measure*, *Motion*, &c. observe this

*Rule.* Multiply the given *Decimal* by the *Number* of *Units* contain'd in the next lower *Denomination* of that *Species* of *Quantity*, which your *Decimal* is of; and thus proceed, till

## Reduction of Decimals, &c.

till you have converted your Decimals, or come to the lowest Part; and the several Products will be the several Parts of the Quantity required. See the following Examples:

### EXAMPLE I.

What common Parts of a Pound (*viz.* Shillings, Pence, &c.) are contain'd in 0,73825 Decimal Parts of a Pound?  
First, Multiply by 20 Shillings, the next lower Dem.

Then Multiply by 12 the next lower De. to the last.

Lastly, Multiply by 4 the lowest Denomin. of all.

0,72000 Farthings.

Hence the Answer is 14 Shillings, 9 Pence, and 7 Tenths, or 72 Hundredths of a Farthing.

### EXAMPLE II.

Reduce 0,72083 to the known Parts of a Crown.

$$\begin{array}{r}
 5 \\
 \hline
 3,60416 \\
 12 \\
 \hline
 7,24999 \\
 4 \quad \text{Answer } 3 \text{ s. } 7 \text{ d. } \frac{1}{4}. \\
 \hline
 0,99999
 \end{array}$$

### EXAMPLE III.

Reduce 5,890625 into known Parts of a Mark.

$$\begin{array}{r}
 13,3 \\
 \hline
 9) 2,671875 \\
 \quad ,2968750 \\
 \quad 2671875 \\
 \quad 890625 \\
 \hline
 11,8750000 \\
 12 \\
 \hline
 10,5000000 \\
 4 \\
 \hline
 2,0000000
 \end{array}$$

Thus the Answer is exact without any Remainder, *viz.*

Marks    s.    d.  
5 : 11 : 10 :  $\frac{1}{2}$ .

E X A M-

E X A M P L E I V.

Reduce ,727564 into the known Parts of a Pound Troy.

$$\begin{array}{r}
 727564 \\
 \hline
 12 \\
 \hline

 \hline
 16 \\
 \hline
 413856 \\
 \hline
 68976 \\
 \hline
 11,03616 \\
 \hline
 16 \\
 \hline
 21696 \\
 \hline
 3616 \\
 \hline
 0,57856
 \end{array}$$

The Answer will stand thus, 1 gr. 27 lb. 11 oz. 0 $\frac{1}{2}$  dr.

## EXAMPLE VI.

Reduce ,578 of a *Rod* into its known Parts.

$$\begin{array}{r}
 5,5 \\
 \hline
 289x \\
 28928 \\
 \hline
 3,182x \\
 \hline
 3 \\
 \hline
 0,546x \\
 12 \\
 \hline
 6,558x
 \end{array}$$

The Answer is 3 *yds.* 0 *Ft.* 6  $\frac{1}{2}$  *In.*; and this repeating Decimal ,0585 over.

These six Examples I imagine sufficient to shew the *common* Method of *reducing Decimal Parts* into the common and known Parts of any Species of Quantity.

But as those *Operations of Reduction* are for the most part very *laborious, tedious,* and require *abundance of Figures,* I have sometimes wondred that a *Set of Tables* have not been compos'd to *facilitate* this Part of *Decimal Arithmetick,* as well as for the *contrary* Operations of *reducing different Species* into Decimals; especially since *one* is as *necessary* as the *other.* *Tables* for that purpose have long since been contriv'd, but none for the *reverse;* to turn *into,* but not to turn *out* of *Decimals.*

'Tis true, some *Decimals* (as those of *Money*) have the *first* and sometimes the *second* Figure pretty easily valued by a small Application of thought; but even this is for the *Skilful* to do, not for any that are but *Tyro's,* or *rude* in the Art. Yet how much *Tables* for *Reduction of Decimals* to *vulgar* Parts are wanting, may appear from the great Industry many have us'd to lay down *Rules* for that purpose. which being *so prolix, verbose, obscure,* and consequently *impertinent,* that a Person wou'd sooner and with more ease and pleasure work out his Answer by the *ordinary* Method than by those *unintelligible* and *insignificant* Rules; and according to the *old Saw,* wou'd find the farthest way about, the nearest way home.

But

## Description and Use of New Tables. 75

But having for Reasons already render'd determin'd to write a *complete Treatise of Decimal Arithmetick*, I thought it could by no means be *worthy of*, or *answer that Title*, unless with many other *Improvements*, I could make one more to render this Part of the Art *most easy and expeditious*; and having imploy'd my Thoughts a little on this *Topic*, I soon perceiv'd an *Expedient* that wou'd do the business, which was this.

*Viz.* To divide the Figures of *Decimals* into *Pairs*, from the left Hand to the right; then to *tabulate* the *Digits* of every *Pair* from *Units* to an *Hundred*, in proper Columns; and lastly, to *affix the true Value* of every Place of Figures in the Column *appositely* answering thereto.

So that by this means the *Value* of any *two Places* of Figures (so far as they are valuable) in any *Decimal*, is seen by *Inspection* only; and the Value of four or six Places are as it were plac'd in one view, and with the greatest *ease and readiness* are obtain'd in any common Species of *Coins, Measures, and Weight*. But it being a Contrivance of *my own*, I shall not on that Account say any thing as to their Merit; but only give a short *Description* of the *Tables* and the *Manner* of using them by an Example of each.

### A Description of the following new Decimal Tables.

For every *different Kind of Decimals* in common Use, I have compos'd a proper Set of *Tables*, and according as the *Decimal* is *more* or *less* valuable, it is divided into two or three Pairs; and to each of these Pairs is a *Table* exhibiting the *true value* of the *Figures* in each *Pair* from *Unit* to 100. The *Tables* of every sort are seen at the *top* of the Page; thus represented *Table 1. Table 2. &c.* Each *Table* consists of *several Columns*; the *first Column* has at *Top No.* to signify the *Numbers* of the *Decimal Pairs*. The other *Columns* (all but the last) represent the *Value of the Numbers* in the *first Column* in the *various Denominations* of the Parts the *Integer* are *vulgarly* known by. The *last Column* contains the *Decimal Parts* of the *last Denomination*, and in every *Table* is marked with *P.ts.*

Having given a *brief Explanation* of the *Tables* in general, I shall now shew their Use in discovering the *Value* of

## 76 Description and Use of New Tables, &c.

any *Decimal* given, which is thus. Suppose you would know the *Value* of the *Decimal* ,689457 of a *Tun Averdupois Weight*, proceed thus; first divide those Numbers into *Pairs* as here, 68,94,57; then take the *first* right *Hand Pair*, viz. 57, and seek in *Table 1. Averdupois Weight*, and you will

find against  $\left\{ \begin{array}{l} 7 \text{ — } 0 \text{ — } ,25 \\ 50 \text{ — } 1 \text{ — } ,79 \end{array} \right\}$  that is,  $\overset{\text{oz.}}{2,04}$ ; then for the *second* Pair, 94, look in *Table 2.* and against 94 you see 21 *lb.* 0 *oz.* 52 *parts.*; and for the *third* Pair, 68, seek in *Table 3.* and against 68 you observe 13 *C.* 2 *qr.* 11 *lb.* 3,2 *oz.* So that these several Numbers added in a proper manner will stand thus,

		<i>C.</i>	<i>qr.</i>	<i>lb.</i>	<i>oz.</i>
Against the	}	First Pair	,57	— 00	: 0 : 00 : 02,04
	}	Second Pair	,94	— 00	: 0 : 21 : 00,52
	}	Third Pair	,68	— 13	: 2 : 11 : 03,2
Hence the value of ,689457 is				13 : 3 : 04 : 05,76	

Now that the Reader may see at once both the *Advantage* and *Exactness* of the *Tables*; I shall shew the *Work* of finding the value of the said *Decimal*, at large in the *common* way of *Reduction*, which is as follows.

$$\begin{array}{r}
 \text{,689457 of a Tun.} \\
 \hline
 20 \\
 \hline
 13,789140 = \text{Hundred.} \\
 \hline
 4 \\
 \hline
 3,156560 = \text{Quarter of C.} \\
 \hline
 28 \\
 \hline
 1252480 \\
 313120 \\
 \hline
 4,383680 = \text{Pounds.} \\
 \hline
 16 \\
 \hline
 2302080 \\
 383680 \\
 \hline
 6,138880 = \text{Ounces.}
 \end{array}$$

The

	C.	qr.	lb.	oz.
The Value this way is	13	3	04	06,1388 &c.
The Value by the Table is	13	3	04	05,76
The Difference only	<u>00</u>	<u>0</u>	<u>00</u>	<u>00,3788</u>

Hence it appears how *exact*, and yet how *easy* and *expeditious* these *Tables* are in the business of *Reducing Decimals* to their *proper Value* in the *common* and *vulgar* Parts of their *proper Integer*. I shall next give *Examples* of all kinds of *Decimal Parts*, in order to render the *Use* and *Emoluments* of these *new invented Tables*, as *plain* and *obvious* as may be; tho' they are of themselves as *easy* to be understood as any *Arithmetical Tables*, whatsoever.

E X A M P L E I

What is the Value of ,4725 of a *Pound Sterling*?

In	{	Table 1.	}	against	{	,25 is	—	00 : 0 : $\frac{1}{2}$ ,4
		Table 2.				,47 is	—	9 : 4 : $\frac{1}{2}$ ,2
						Answer	<u>9 : 5 : <math>\frac{1}{4}</math>,6</u>	

E X A M P L E II.

What is the Value of ,147 of a *Shilling* or *Foot*?

In	{	Table 1.	}	against	{	,70 is	—	00 : 0,336
		Table 2.				,14 is	—	01 : 2,72

**EXAM-**

EXAMPLE VIII.

What is the Value of ,8495 of a Year?

		<i>M.</i>	<i>W.</i>	<i>D.</i>	<i>H.</i>	
In {	<i>Table 1.</i>	}	against	{	,95 is —	07 : 0 : 3 : 11,22
	<i>Table 2.</i>				,84 is —	10 : 3 : 5 : 14,4
Answer					<u>11 : 0 : 2 : 01,62</u>	

EXAMPLE IX.

What is the Value of ,889 of an Hour or Degree?

In {	<i>Table 1.</i>	}	against	{	,90 is —	— : — : 00 : 32,4
	<i>Table 2.</i>				,88 is —	— : — : 52 : 48,
Answer					<u>53 : 20,4</u>	

EXAMPLE X.

What is the Value of ,0596 of a Sign of the Zodiac?

In {	<i>Table 1.</i>	}	against	{	,96 is —	00 : 17 : 16
	<i>Table 2.</i>				,05 is —	01 : 30 : 00
Answer					<u>01 : 47 : 16</u>	

EXAMPLE XI.

What is the Value of ,976305 of a Mile?

		<i>Fr.</i>	<i>R.</i>	<i>Yd.</i>	<i>Ft.</i>	<i>In.</i>
In {	<i>Table 1.</i>	}	against	{	,05 is 0 : 00 : 0 : 0 : 00,31	
	<i>Table 2.</i>				,63 is 0 : 02 : 0 : 0 : 02,79	
	<i>Table 3.</i>				,97 is 7 : 30 : 2 : 0 : 07,2	
Answer					<u>7 : 32 : 2 : 0 : 10,3</u>	

EXAM-

80 *The Use of the new Tables, &c.*

EXAMPLE XII.

What is the Value of ,278 of a *Yard square* ?

In	{	<i>Table 1.</i>	}	against	{	,80 is	—		<i>F. q.</i>	<i>In. q.</i>
						,27 is	—		0 : 10,33	
									2 : 61,92	
								Answer	2 : 72,25	

EXAMPLE XIII.

What is the Value of ,795007 of a *Mile square* ?

In	{	<i>Table 1.</i>	}	against	{	,07 is	—		<i>A.</i>	<i>R.</i>	<i>P.</i>
						,50 is	—		0 : 0 : 00,71		
						,79 is	—		3 : 0 : 32		
									505 : 2 : 16		
								Answer	508 : 3 : 08,71		

EXAMPLE XIV.

What is the Value of ,974 of an *Acre* ?

In	{	<i>Table 1.</i>	}	against	{	,40	—		<i>R.</i>	<i>P.</i>	<i>Y.</i>
						,97	—		0 : 00 : 19,36		
									3 : 35 : 06,05		
								Answer	3 : 35 : 25,41		

EXAMPLE XV.

What is the Value of ,629 of a *Yard solid* ?

In	{	<i>Table 1.</i>	}	against	{	,90 is	—		<i>F.</i>	<i>In.</i>
						,62 is	—		00 : 419,94	
									16 : 1278,72	
								Answer	16 : 1698,66	

TABLE

## C H A P. VI.

The Use of DECIMALS in all the Rules of Proportion, *viz.* The Rule of Three direct and Inverse; and the double Rule of Five Numbers.

**D**IRECT Proportion is, when of four Numbers, the first is in the same Proportion bigger or less than the second, as the third is bigger or less than the fourth Number. Thus as 4 is to 12 so is 6 to 18; consequently the two middle Numbers multiplied together, are equal to the Product of the two extreme ones; as  $12 \times 6 = 18 \times 4 = 72$ . Hence is deduced the general Rule for working all Questions in the Rule of Three direct, *viz.*

Multiply the second Number by the third, and divide by the first; and the Quotient will be the fourth Number sought, or Answer.

Now as these Rules of Proportion have some certain Numbers given to find others in the same Proportion, and their Subject being generally *Trade* and *Merchandise*, those given Numbers often consist of *diverse Parts* and *Denominations*, which therefore are to be reduced to *Decimals*, in order for the Question to be wrought in the simplest Manner, and with the greatest ease and expedition; which ought to be the *Aim* of every *Artist*.

But as the Manner of Reducing the Parts of *Coins*, *Measures*, *Weights*, &c. hath been fully taught already; I shall only here express the Question *vulgarly*, but state and work it *decimally*.

*Question. 1.* If  $7 \frac{1}{4}$  Yards of Cloth cost 2*l.* 12*s.* 9*d.* What will 140  $\frac{1}{2}$  Yards cost at that Rate?

Thus

Thus stated  $\left\{ \begin{array}{l} \text{Vulgarly } 7\frac{1}{2} : 2 - 12 - 9 :: 140\frac{1}{2} \\ \text{Decimally } 7.75 : 2.6875 :: 140.5 \end{array} \right.$

 \end{array}$$

These are the various Cases which may happen in the Rule of Three Direct; by which any one may observe the Advantage of Decimals, and the absolute Necessity of understanding the Management of circulating or repeating Decimals.

The Rule of Three Inverse.

*Inverse Proportion* is, when of four Numbers, the third bears the same Ratio or Analogy to the first, as the second does to the fourth.

Whence the Rule is; to multiply the first and second of the given Numbers, and divide that Product by the third; the Quotient will be the fourth Number, or Answer.

To know when the Terms of a proposed Question are in this reciprocal or inverse Proportion, observe this Rule; viz. When the third { Bigger } than the first, { Less, } The Number is { Lesser } and requires { More, } Terms

S

Terms

130 *in the Golden Rule direct.*

Terms are in the *inverse Ratio*; and are to be worked by the *Rule* above; as in the following Instances.

*Question 1.* If when Wheat is sold for 6 s. 6 d. per Bushel, the Penny White Loaf ought to weigh eight Ounces Troy; What must it weigh when it is at 4 s. per Bushel?

Thus stated { Vulgarly 6 s. 6 d. : 8 oz. :: 4 s.  
Decimally 6,5 : ,8 lb. :: 4 s.

$$\begin{array}{r}

 \end{array}$$

*Question 2.* Two Equal *Parallelograms* A, B given, the Length of A is 8 Feet 8 Inches, and its Breadth 4 Feet and 3 Inches; the Breadth of B is 2 Feet 10 Inches, Quere its Length?

Thus stated { Vulgarly 4 — 3 : 8 — 8 :: 2 — 10  
Decimally 4,25 : 8,8 :: 2,83

	$  \begin{array}{r}  \text{F. In.} \quad \text{F. In.} \quad \text{F. In.} \\  4 \text{ — } 3 : 8 \text{ — } 8 :: 2 \text{ — } 10 \\  4,25 : 8,8 :: 2,83 \\  8,8  \end{array}  $		
4,25	<div style="border: 1px solid black; display: inline-block; padding: 2px;">8,8 A</div>	)	$  \begin{array}{r}  2550 \\  2833 \\  \hline  3400  \end{array}  $
		)	<div style="border: 1px solid black; display: inline-block; padding: 2px;">2,83 B</div>
			13
			$  \begin{array}{r}  2,83 \cdot 36,83 \\  28 \cdot 368 \\  \hline  2,55 \cdot 3315 \\  255 \\  \hline  765 \\  765 \\  \hline  \dots  \end{array}  $

(13 Inches the Answer.)

*Question*

Question 3. A Piece of Land 4 Rod broad and 40 long, being a Statute-Acre; tis required to know what Length, with 10 Rod and 2 Yards Breadth, will make an Acre?

	R.		R.	Y.
Stated thus	{	Vulgarly	4 : 40 ::	10 — 2
		Decimally	4 : 40 ::	10,26
			4	
			10,26	160,0
		10	16	
		10,26	158,4	(15,438 = 15 : 2 : 1 : 2
			1026	
			5580	
			5130	
			4500	
			4104	
			396	

The Double Rule of Three ; or Rule of Five Numbers.

In this Rule of Proportion there are Five Numbers given to find a Sixth in Proportion; which is either Direct or Inverse, according to the Nature of the Question.

Questions in this Rule are performed at two Operations, that is, by a double stating the Question, most generally.

Question 1. What is the Interest of 364 l. 5 s. for seven Months, three Weeks, at the Rate of 4 l. 10 s. per Cent. per Annum?

		l.	M.	l.	s.	l.	s.	M.	W.
Thus stated	{	Vulgarly	100 : 12 : 4 — 10 ::	364 — 5 : 7 — 3					
		Decimally	100 : 12 : 4,5 ::	364,25 : 7,75					
			l.	l.	l.				
		First Operation,	100 : 4,5 ::	364,25					
				45					
		Hence the Interest of 364,25 l. } for one Year, is 16,39125 l. }		182125					
				145700					
				100	1639,125	(16,39125			

132 *in the Golden Rule direct.*

Then,  $M^o.$   $l.$   $M^o.$   
 Second Operation  $12 : 16,39125 : 7,75$   
 $\underline{57.7}$

114739

11474

819

$12 ) 127,032 ( 10,586 = 10 : 11 : 8 \frac{1}{2}$   
 The Answer.

*Question 2.* Suppose it were required to know what *Prin-*  
*cipal* would gain  $15\ l.$   $14\ s.$   $8\ d.$  in nine Months and three  
 Days, at the Rate of  $4\ l.$   $10\ s.$  *per Cent, per Annum, Quere.*  
 the Answer?

$l.$   $s.$   $M^o.$   $l.$   $l.$   $s.$   $d.$   $M^o$   $D.$   
 Thus { Vulgarly  $4 : 10 - 12 - 100 - 15 : 14 : 8 - 9 : 3$   
 stated { Decimally  $4,5 - 12 - 100 - 15,78 - 9,107$

The First Operation *Direct.*

$l.$   
 $4,5 : 100 :: 15,78$   
 $\underline{100}$

$4,5 ) 1578,3 ( 348,62$   
 $\underline{135}$

The Principal  
 from whence  
 $15,78\ l.$   
 comes in 12  
 Months is  
 $348,62\ l.$

223

180

433

405

283

270

133

90

43

*Ad infinitum.*

The Second Operation therefore must be wrought *in-*  
*versely.*

Thus,

Thus,  $M^a.$   $12 : 348,62 :: 9,107$   $M^c.$

$$\begin{array}{r}
 69724 \\
 348629 \overline{) 4198,5} \\
 \underline{36428} \\
 55275 \\
 54642 \overline{) 55275} \\
 \underline{54642} \\
 \text{..} 63355 \\
 54642 \overline{) 63355} \\
 \underline{87135} \\
 81969 \overline{) 87135} \\
 \underline{5192}
 \end{array}$$

$4198,5 (460,6956 = 460 : 13 : 11$

But any Question in this Rule may be answered at *one Operation*, by the following *Rule* :

Make the  $\left. \begin{array}{l} 1^{st} \\ 2^{d} \\ 3^{d} \end{array} \right\}$  Number of the  $\left. \begin{array}{l} 4^{th} \\ 5^{th} \\ 6^{th} \end{array} \right\}$  Number given.  
 $\left. \begin{array}{l} 1^{st} \\ 2^{d} \\ 3^{d} \end{array} \right\}$  Five, the same kind with the  $\left. \begin{array}{l} 4^{th} \\ 5^{th} \\ 6^{th} \end{array} \right\}$  the Num. sought.

Then, Multiply the *Three* Numbers to the Right-hand together, and the *two first* to the Left-hand ; and divide the *first Product* by this *last*, and the *Quotient* will be the sixth Number, or *Answer*, if the Proportion be *Direct*.

*Question 3.* If a 1000 Men can dig a Trench 500 Feet Long in 24 Hours, what Length of such a Trench can 9800 Men dig in 10 Hours ?

Thus

*in the Golden Rule direct.*

Thus stated,  $\begin{array}{l} \text{Men Hours Feet} \\ 1000. 24 : 500 :: 9800. 10. \\ \hline 24 \\ \hline 24000 \end{array}$

$\begin{array}{l} \text{Men Hours} \\ 98000 \\ \hline 500 \\ 24 \overline{) 100000} \overline{) 000} (2041,6 \\ 48 \dots \\ \hline 100 \\ 96 \\ \hline 40 \\ 24 \\ \hline 160 \\ 144 \\ \hline 16 \end{array}$

The Answer is  
*Feet Feet In.*  
 2041,6 = 2041 : 8  
 The Length required.

} *In Infinitum.*

If any Part of the Question be in *reciprocal or inverse* Proportion; place the Three first Numbers as in the last Question; and of the other two, place *That* the fourth, which is of the same kind as the second; and consequently the other must be the fifth Number.

Question 4. If 1000 Men can dig a Trench in 24 Hours 500 Feet Long, How many Men will dig 2041,6 Feet in 10 Hours?

Stated thus,  $\begin{array}{l} \text{Men H. Feet. Ft. Feet.} \\ 1000 : 24 : 500 :: 10 : 2041,6 \\ \hline 10 \qquad \qquad \qquad 1000 \end{array}$

*Rule.* Multiply the 1st, 2d, and 5th Numbers, and the 3d, and 4th; then divide the first Product by the last, the Quotient is the Answer; viz. 9800 Men.

$\begin{array}{l} 5000 \qquad \qquad \qquad 2041866,6 \\ \hline 24 \\ \hline 816666,6 \\ 4083333,3 \\ 5 \overline{) 10000000} \overline{) 000} (9800 \\ \hline 45 \\ \hline 40 \\ 40 \\ \hline \dots 00 \end{array}$

But for the greater readines and ease of the *ingenious Arithmetician*, I shall transcribe that famous *general Theorem* in

in Mr. Ward's *Young Mathematician's Guide*, which shews at once how to answer any Question of *Five Numbers* at one Operation, without regard to the Proportion of the Terms; be that *Direct* or *Indirect* as it will.

The *Theorem* is this,  $TgP = Gpt$ . In this *Theorem* you observe three *Capital Letters*, viz. *T, P, G*, and the same three Letters in *small Characters*, *g, p, t*. The three *Capitals* signify the *Three first conditional Terms* of the Question,

Thus,  $\left\{ \begin{array}{l} P, \text{ Is the Principal Cause of Gain, Loss, Action, \&c.} \\ T, \text{ Is the Time, Space, Distance, \&c.} \\ G, \text{ Is the Gain, Loss, Action, \&c.} \end{array} \right.$

Of the *Three small Letters*, (which correspond to, and signify the same with the *Capitals*) two always move the Question, the other shews the *Answer*; which, as the Letters are three, is *threefold*; and answered by the same *Theorem* disposed in these three proper *Terms*.

$$\text{Viz. If } \left\{ \begin{array}{l} P \\ t \\ g \end{array} \right\} \text{ be sought, the Theorem is } \left\{ \begin{array}{l} \frac{TgP}{tG} = P. \\ \frac{TgP}{Gp} = t. \\ \frac{GtP}{TP} = g. \end{array} \right.$$

Or thus,  $TgP \div Gt = p. \quad TgP \div Gp = t. \quad Gpt \div TP = g.$

If any *Arithmetician* should complain he does not understand such *Algebraic Forms and Characters*, all that I have to answer is, That 'tis a very *necessary Part* of his *Business* and *Profession*, and *highly concerns him to learn it*.

## C H A P. VII.

*A New Decimal Practice; or a short Way  
of computing all kind of Merchandise by  
DECIMALS.*

**T**HOUGH there is scarce any Part of *Arithmetick* in which *Decimals* are of greater (or indeed so great) Service, as *Practice*; yet this of all others has been the least improv'd by it; hardly an Author can be met with on this Head; and those who have undertaken it, have presented us with but imperfect Sketches, and left the Matter unfinished. I hope what follows in this Chapter will give Satisfaction in this Point.

The Tables of aliquot Parts commonly used, are these

s.	d.	Parts.
20	0	2
6	8	3
5	0	4
4	0	5
3	4	6
2	6	8
2	0	10
4	8	12

The even or aliquot Parts of a Pound Sterling. By which dividing, gives an Answer in Pounds.

s.	Parts.
6	2
4	3
3	4
2	6
1½	8
1	12

The even or aliquot Parts of a Shilling Sterling. By which dividing, gives an Answer in Shillings.

But the Table following is far more general, expeditious and useful; and has not yet been applied to *Decimal Practice*.

*A General Table for Decimal Practice.*

Price.	Divisors.	Price.	Divisors.	Price	Divisors.

6 : 0	40.				

*An Explanation of the preceding Table.*

The first Column shews the *Price* of the *Commodity*, either in *Pence* and *Farthings*, or in *Shillings*, for one of a sort; as one *Pound*, *Yard*, *Piece*, &c.

Against the *Price*, you observe in the second Column, several Numbers, of which those which stand first, and have nothing prefix to them, are *Divisors*; by which any given *Quantity* or Number of *Yards*, *Ells*, *Pounds*, are to be divided.

If any Number follow these with any *Character prefix* to them as  $3,40, \times 2, + 8$ .  $80, \times 3, - 12$ , &c. They are to be understood, and read, as in the following Examples.

$3,4, - 8$	}	From a 4th of a 3d, take one 8th of that 4th
$3,4, + 8$		To a 4th of a 3d add an 8th of that 4th.
$3,40, \times 2, + 8$	}	To a 40th of a 3d, multiplied by 2, add an 8th of that 40th.
$60, + 8, 2$		To a 60th add an 8th of that 60th, and half of that 8th.
$3, + 2, - 16$	}	To a 3d add an half of that 3d, then subtract a 16th of that 3d.
$1, - 20$		From the given Number take one 20th Part.

These being well understood, 'twill not be difficult to use the Table on all occasions with ease; especially after perusing the Examples ensuing, which are chosen for the more difficult Parts thereof.

*Note*, When the *Price* consists of *Shillings* only, the Number may be multiplied by the *Decimal*, that is, *half the Number of Shillings*, and the Answer will be the same.

*Ex. 1.* At 1*q.* per Yard, What cost 144 Yards?

$$\begin{aligned} \text{One 3d} &= 48 \\ \text{One 4th of that} &= 12 \\ \text{One 80th of that} &= 0,15 = 3 \text{ s. Answer.} \end{aligned}$$

*Ex. 2.* At 3*q.* per Yard, What cost 172,5 Yards?

$$\begin{aligned} \text{One 4th} &= 43,125 \\ \text{One 80th of that} &= 0,53907 = 10 \text{ s. } 9 \text{ d } \frac{1}{4}. \end{aligned}$$

*Ex. 3.* At 1*d.* 1*q.* What cost 1792,25

$$\begin{aligned} \text{One 4th} &= 448,0625 \\ \text{A 6th of that} &= 74,67708 \\ \text{An 8th of that} &= 9,33463 = 9 \text{ l. } 6 \text{ s. } 8 \frac{1}{2} \text{ d.} \end{aligned}$$

*Ex. 4.* At 1*d.* 3*q.* What cost 9742,6

$$\begin{aligned} \text{One 3d} &= 3247,8 \\ \text{A 40th of that} &= 81,18888 \\ \text{From which take an 8th} &= 10,1436x \quad \text{l. s. d.} \\ \text{Remains the Answer} &= 71,04527 = 71 : 00 : 10 \frac{1}{4} \end{aligned}$$

*Ex.*

*Ex. 5. At 2 d. 1 q. What cost 369<sup>s</sup>,2<sup>d</sup>?*  
 One 3d = 123<sup>s</sup>,08  
 A 40th of that = 30,8020<sup>s</sup>  
 To which add one 8th = 3,85025 *l. s. d.*  
 The Sum the Answer = 34,6523 = 34 : 13 : 0½

*Ex. 6. At 2 d. 3 q. What cost 413<sup>s</sup>,21?*  
 One 8th = 51,627  
 From which take a 12th = 4,302 *l. s. d.*  
 Remains the Answer = 47,325 = 47 : 6 : 6

*Ex. 7. At 4 d. 1 q. What cost 193<sup>s</sup>,49?*  
 One 3d = 64<sup>s</sup>,16  
 A 40th of that = 16,104  
 Ditto = 16,104  
 Of which add an 8th = 2,013 *l. s. d.*  
 The Sum is the Answer = 34,221 = 34 : 4 : 5

*Ex. 8. At 4 d. 3 q. What cost 948,4<sup>s</sup>?*  
 One 6th = 15,807  
 One 8th of that = 1,975  
 One half of that = 0,987 *l. s. d.*  
 The Sum is the Answer = 18,771 = 18 : 15 : 5

*Ex. 9. At 5 d. 3 q. What cost 101<sup>s</sup>,2?*  
 One 8th = 12,6  
 2  
 One 8th, × 2 = 25,33  
 Subtract a 12th of an 8th = 1,08 *l. s. d.*  
 Remains the Answer = 24,27 = 24 : 5 : 6½

*Ex. 10.* At 8*d.* 1*q.* What cost 2640?

$$\begin{array}{r} \text{One 80th} = 33 \\ \hline 3 \end{array}$$

That multiplied by 3 = 99

$$\text{Subtract a 4th of an 80th} = \underline{8,25} \quad \text{l. s. d.}$$

$$\text{Remains the Answer} = \underline{90,75} = 90 : 15 : 0$$

*Ex. 11.* At 9*d.* 1*q.* What cost 96*x*, 9*x*?

$$\begin{array}{r} \text{One 80th} = 12,024 \\ \hline 3 \end{array}$$

An 80th  $\times$  3 = 36,07*x*

$$\text{To which add 12th of an 80th} = \underline{1,00*x*} \quad \text{l. s. d.}$$

$$\text{The Sum is the Answer} = \underline{37,074} = 37 : 1 : 5\frac{1}{4}$$

*Ex. 12.* At 10*d.* 3*q.* What cost 1600

$$\begin{array}{r} \text{One 40th} = 40 \\ \hline \end{array}$$

$$\text{Add an half} = 20$$

$$\text{Add half that} = 10$$

$$\text{Add a sixth of that} = \underline{1,6} \quad \text{l. s. d.}$$

$$\text{The Sum is the Answer} = \underline{71,6} = 71 : 13 : 4$$

*Ex. 13.* At 11*d.* 3*q.* What cost 90*s*, 18?

$$\begin{array}{r} \text{One 30th} = 30,20*s* \\ \hline \end{array}$$

$$\text{To which add an half} = \underline{15,10*s*}$$

$$\text{From the Sum} = 45,30*s*$$

$$\text{Subtract a 16th} = \underline{0,24*s*} \quad \text{l. s. d.}$$

$$\text{Remains the Answer} = \underline{44,36*s*} = 44 : 7 : 3\frac{1}{2}$$

*Ex. 14.* At 7*s.* What cost 365,25?

$$\begin{array}{r} \text{One 10th} = 36,525 \\ \hline 3 \end{array}$$

One 10th  $\times$  3 = 109,575

$$\text{To which add half that 10th} = \underline{18,2625} \quad \text{l. s. d.}$$

$$\text{The Sum is the Answer} = \underline{127,8375} = 127 : 16 : 9$$

*Ex.*

*Ex. 15.* At 19 s. What cost 257, 8?  
 Subtract a 20th =  $\frac{12,88z}{1}$  l. s. d.  
 Remains the Answer =  $\frac{244,78z}{1}$  = 244 : 15 : 8

*Ex. 16.* At 13 s. 9  $\frac{1}{4}$  d. What cost 96x, 9z?  
 10th =  $\frac{96x,9z}{6}$  } For 13 }  
 10th  $\times 6$  =  $\frac{577x,5z}{6}$  } *Sbil.* }  
 $\frac{1}{2}$  of 10th =  $\frac{48,09z}{6}$  }  
 The Sum =  $\frac{625,24z}{6}$  }  
 80th =  $\frac{12,02z}{3}$  } For the  
 80th  $\times 3$  =  $\frac{36,07z}{3}$  } 9  $\frac{1}{4}$  d.  
 12 of 80 =  $\frac{1,00z}{3}$  } s. d.  
 Add {  $\frac{37,07z}{3}$  for 0:9  $\frac{1}{4}$   
        $\frac{625,24z}{3}$  for 13:00  
 The Answer =  $\frac{662,22z}{3}$  for 13:9  $\frac{1}{4}$

In this Example (and any other) the Answer for the *Shillings* is found with least trouble, and Figures, by *Multiplying the given Number* by the *Decimal* of the *Shillings*,

Thus,  $\left\{ \begin{array}{l} 96x,9z \text{ The given Number.} \\ \underline{\phantom{00}65} \text{ The Decimal of a Pound for 13 s.} \\ 480960 \\ 577x5z1 \\ \hline 625,24z \end{array} \right.$  The same as before.

If the *Price* or *Value* consist of *Pounds, Shillings, Pence, &c.* the most *ready* and *practical* way, is to turn the *whole* into *Decimals*, then multiply the given Number (turn'd into *Decimals* also, if express'd in *diverse Parts*;) and the *Product* will be the *Answer*.

*Ex. 17.* At 5 l. 16 s. 8 d. What cost 270? l. s. d.  
 $\frac{5,8z}{1} = 5 : 16 : 8$   
 $\begin{array}{r} 9) 810 \\ \hline 900 \\ 2160 \\ 1350 \\ \hline \end{array}$   
 The Answer =  $\frac{1575,00}{1}$

*Ex.*

142 *The Use of Decimals in Fellowship.*

Ex. 18. At  $1 : 17 : 3\frac{1}{2}$  What cost 14 : 1 : 14 : 10?

Then,  $\left\{ \begin{array}{l} 14,38058 \\ 526568,1 \end{array} \right.$  The Multiplier inverted.

143805  
115044  
8628  
719  
86  
3

The Answer  $\underline{\underline{L. 26,8285}} = 26\text{ l. } 16\text{ s. } 6\frac{1}{2}\text{ d.}$

These Examples are sufficient to the ingenious Practical Student of *Decimal Arithmetick*; who with those Instructions will easily (*proprio Marte*) apply this noble Art to all Cases of *Common Trade* and *Merchandise*.

C H A P. VIII.

*The Use of DECIMALS in the Rules of Fellowship, Tare and Trett, Barter, Gain and Loss, Exchange, Alligation, Rule of False Position, Extraction of Roots,*

*Single Fellowship ; or That without Time.*

**T**HE *Rules of Fellowship* are proper to *Merchants* and those who *Trade in Company*, or *Partnership*; where they have a *common Joint-Stock* to traffick withal; for to every one of the Company is distributed his *due share* of *Gain* or *Loss* acquired by *Trading*, in proportion to his *Stock laid out*, by this following

*Rule*

## 144 *The Use of Decimals in Fellowship.*

$\begin{array}{r} \text{C's Part of Stock} = 95,03 \\ \text{Multiply by } \underline{,2109} \\ 85529 \\ 950333 \\ \hline 19006666 \end{array}$	$\begin{array}{r} \text{D's Part of Stock} = 60,8 \\ \text{Multiply by } \underline{,2109} \\ 5472 \\ 6080 \\ \hline 1216 \end{array}$
$\text{C's Part of Gain} = \underline{20,04253}$	$\text{D's Part of Gain} = \underline{12,82272}$

Here every Man's Share is the same as before.

### Double Fellowship, or *That with Time.*

*Fellowship with Time* considers the *Share* of the *Gain* or *Loss* with regard to the *Money*, and the *Time* it was employed, and *proportionates it to both* by the following

Rule.

*Multiply each Man's Stock by the Time it was employed; then say, As the sum of those Products, is to the whole Gain or Loss; so is every one of the Products, to its proportional Part of the Gain or Loss.*

*Example.* Three Merchants *A*, *B*, and *C*, enter into *Partnership*, thus;

l.	
A	puts in 65,5 for 8 Months, 2 Weeks, and 3 Days.
B	— 78,6 — 12 Months, 3 Weeks, and 1 Day,
C	— 84 — 6 Months, and 6 Days.

They traffick and gain 140,016 l. 'Tis required to find each Man's Share proportional to his Stock, and Time 'twas in.

	l.	Months.	Products.
{	A's Stock	65,5 × 8,607	= 563,7585
	B's Stock	78,6 × 12,3357	= 970,4084
	C's Stock	84, × 6,214	= 521,976
	$\underline{\text{The Sum of the Products} = 2056,1429}$		

Then

## The Use of Decimals in Tare and Trett. 145

$$\begin{array}{l}
 \text{Then, As} \\
 2056,1429 : 140,018 \left\{ \begin{array}{l}
 :: 563,7585 : 38,3918 = A \\
 :: 970,4084 : 66,0846 = B \\
 :: 521,976 : 35,5465 = C
 \end{array} \right.
 \end{array}$$

The whole Gain very near = 140,0229 *l.*

Questions in this Rule also are much better answer'd by finding the Proportional Part to one Pound, for a common Multiplier, as before.

*l.*

Thus, as 2056,1429 : 140,018 :: 1 : ,0681 Common Multiplier.

The Operation for *A*, = 563,7585. For *B* = 970,4084  
 The Multiplier inverted 1860,0 1860,0

338255	582244
45100	77632
563	970
38,3918	66,0806

For *C* = 521,9760  
1860,0

313185  
 41758  
522

35,5465

} Their several Parts of the Gain, as before.

Thus appears the excellent Use of Decimals in the Rules of Fellowship.

### Tare and Trett.

*Tare* is the Weight of the Hogshead, Chest, Bag, Cask, &c. which contain the Goods bought or sold.

*Trett* is an Allowance of 4 lb. in 100, or 104 lb. for Goods wherein is Loss by refuse, &c.

*Cloff* is an Allowance of 2 Pound upon every Draught which exceedeth 300 Gross Weight.

## 146 The Use of Decimals in Tare and Trett.

*Subtile* is the *Weight* when the *Tare* is deducted, but not the *Trett*.

*Neat Weight* is the *Remainder* when *Tare*, *Trett*, and *Cloff*, if all are allowed, are taken away.

For resolving Questions in this Rule there are several *Methods*; but those by *Decimals* are much the shortest and best, and are as follow.

*Question 1.* What is the *Neat Weight* of 9 C. 2 qr. 7 lb. *Tare* at 14 lb. per Cent. to be deducted.

*First*, This may be answered by the *Golden Rule* in *Decimals*.

lb. C.  
If 1 C. allow 14, What will 9,5625 allow for Tare?

$$\begin{array}{r} 14 \\ \hline 382500 \\ 95625 \end{array}$$

Total Tare lb. = 133,875 = 1,1953 C.

Then,  $\left\{ \begin{array}{l} \text{The Gross Weight} = 9,5625 \\ \text{The Whole Tare} = 1,1953 \text{ to be subtracted.} \\ \text{The Difference is} = 8,3672 = 8 \text{ C. } 1 \text{ qr. } 13 \text{ lb.} \\ \text{the Neat Weight.} \end{array} \right.$

A *Second Way*, is to Multiply the *Gross Weight* by the *Decimal* of C. Weight, equal to the *Tare* allow'd.

$$\begin{array}{r} \text{C.} \\ \text{The Gross Weight} = 9,5625 \\ \text{The Decimal of 14 lb.} = ,125 \\ \hline 478125 \\ 191250 \\ 95625 \end{array}$$

The Tare (as before) = 1,1953125 to be subtracted.

A *Third Way*, is to multiply the *Gross Weight* by the *Decimal* of the *Neat Part* of a *Hundred Weight*.

Thus,

The Use of Decimals in Tare and Trett. 147

	C.	C.
Thus, from 1,000	1,000	Then 9,5625
Subtract ,125	,125	578,0
The Neat of C. ,875	,875	Multiplier inverted.
		76500
		6693
		478

The Neat Weight total = 8,3671 as above.

A Fourth Way, is to work by Aliquot Parts as in Practice. Thus 14 being the 8th Part of 112; if you take an 8th of 9,5625, that will be the Tare of the Whole.

C.

Thus,  $\left\{ \begin{array}{l} 9,5625 \text{ the Gross Weight.} \\ \frac{1}{8} = 1,1953 \text{ the Tare, as before.} \end{array} \right.$

For the more expeditious finding the Tare by Aliquot Parts, I have inserted the following Table of Tare and proper Divisors.

Tare.	Divisors.	Tare.	Divisors.	Tare.	Divisors.
1 lb.	2,7,8	8	2,7	15	2,8, X 2, + 7
2	7,8	9	2,7, + 8	16	7
3	7,8, + 2	10	2,7, + 4	17	2,7, X 2, + 8
4	4,7	11	2,7, + 4, 2	18	7, + 8
5	4,7, + 4	12	2,7, + 2	19	7, + 4, - 20
6	4,7, + 2	13	2,7, + 2, 4	20	7, + 4
7	2,8	14	8	21	8, + 2

The Construction and Use of this Table of Tare is the same with the Table of Prices or Values in Practice, which see there right.

Having shewn how to find the Tare, the next Business is to find the Trett, or the Neat Weight when the Trett is deducted from the Subtile;

Thus Multiply  $\left\{ \begin{array}{l} ,0384 \text{ the Product is the Trett.} \\ ,9616 \text{ the Product is the Neat Weight.} \end{array} \right.$

148 *The Use of Decimals in Tare and Trett.*

*Question 2. In 72 C. 3 qr. 12 lb. Grofs, Tare at 12 lb. per C. Trett 4 lb. per 104. How many C. neat ?*

	C.
The Grofs =	72,8571
Multiply by the Decimal of 12 lb. inverted =	1701,0
	<hr style="width: 100px; margin: 0 auto;"/>
	72857
	5100
	72
	<hr style="width: 100px; margin: 0 auto;"/>
The Tare (subtile) =	7,8029
The Subtile =	65,0542
Multiplier inverted =	4830,0
	<hr style="width: 100px; margin: 0 auto;"/>
	19516
	5204
	260
	<hr style="width: 100px; margin: 0 auto;"/>
The Trett to be subtile =	2,4980
The Neat Wt. =	62,5562

*A Shorter Way, thus ;*

	C.
The Grofs =	72,8571
Mult. by the Neat Dec. of 112 lb. inverted =	8298,0
	<hr style="width: 100px; margin: 0 auto;"/>
	582856
	65571
	1457
	582
	<hr style="width: 100px; margin: 0 auto;"/>
The Subtile =	65,0466
The Multiplier inverted =	6169,0
	<hr style="width: 100px; margin: 0 auto;"/>
	585419
	39027
	650
	390
	<hr style="width: 100px; margin: 0 auto;"/>
The Neat Weight =	62,5486

These are the *best Methods* for finding *Tare* and *Trett* ; and that I have here given for finding the *Trett* is *new* to me, not having seen it in any Author I have met with.

Barter.

Barter.

By the Rule of Barter, Merchants and Traders exchange Goods of different Values, Kinds, and Quantities, so as to sustain no Loss or Disadvantage by such a Barter or Change.

Question 1. Two Merchants, A and B barter; A would exchange 5 C. 3 qr. 14 lb. of Pepper, worth 3 l. 10 s. per C. with B for Cotton worth 10 d. per lb. How much Cotton must B give A for his Pepper?

Proceed thus by Decimals to find the Value of the Pepper.

$$\begin{array}{r}
 \text{C.} \quad \text{l.} \quad \text{C.} \\
 \text{Say, As } 1 : 3,5 :: 5,875 \\
 \underline{\quad 3,5} \\
 29375 \\
 \underline{\quad 17625} \qquad \text{l. s. d.} \\
 \text{The Value of the Pepper} = 20,5625 = 20 : 11 : 3
 \end{array}$$

Then to find the Quantity of Cotton equal to the Value of the Pepper;

$$\begin{array}{r}
 \text{l.} \quad \text{C.} \quad \text{l.} \\
 \text{Say, As } ,0416 : ,00892 :: 20,5625 \\
 \underline{\quad 29800,0} \\
 1645 \\
 185 \\
 \underline{\quad 4} \\
 ,0416 \left. \begin{array}{l} ,1834 \\ ,1834 \end{array} \right\} \text{l.} \\
 \underline{\quad 041} \quad \underline{\quad 16506} \quad (4,4016 \\
 ,0375) \quad \underline{\quad 1500} \\
 \underline{\quad 1506} \\
 \underline{\quad 1500} \\
 \dots 600 \\
 \underline{\quad 375} \\
 \underline{\quad 2250} \\
 \underline{\quad 2250} \\
 \dots
 \end{array}$$

Thus B must give A }  
 C. C. qr. lb.  
 4,4016 = 4 : 1 : 17½  
 of Cotton for his Pepper.

Question

150 *The Use of Decimals in Barter.*

*Question 2.* A has 52 Dozen of Hats, worth in ready Money 2s. 6d. but barter at 2s. 9d. per Hat. B has Cotton at 10d. per Pound, ready Money. *Quere* at what Rate per Pound B must barter his Cotton, and how much he must give for the Hats?

First; say, As  $2s. 6d. :: 25 :: 8s. :: 08\frac{2}{3} =$  One Penny.

So that B's Cotton is to be advanced a Penny a Pound in Barter.

Secondly, to find the Value of the (624) Hats in Barter;

*Hat l. Hats l.*  
Say, As 1 : 1375 :: 624 : 85,8

$$\begin{array}{r} 624 \\ \hline 5500 \\ 2750 \\ \hline 8250 \end{array}$$

$85,8000 = 85 : 16$  the Price of all the Hats.

Thirdly to know what Cotton at 11d. per Pound can be had for that Money; *l. C. l. C.*

Say, As  $10458\frac{2}{3} :: 100892 :: 85,8 : 16,6982$

$$\begin{array}{r} 85,8 \\ \hline 7136 \\ 4460 \\ \hline 7136 \\ \hline 2458\frac{2}{3} \end{array}$$

$$\begin{array}{r} 765336 \\ 6458 \end{array}$$

$24125,6888024$  (16,6982 C.

$$\begin{array}{r} 4125 \\ \hline 27630 \\ 24750 \\ \hline 28602 \\ 24750 \\ \hline 40524 \\ 37125 \\ \hline 33990 \\ 33000 \\ \hline 9900 \\ 8250 \\ \hline 1650 \end{array}$$

Hence it appears that B must give in Exchange  
*C. C. Q. lb.*  
 $16,6982 = 16 : 2 : 24$   
of Cotton at 11d. per lb.  
for 52 Dozen of Hats at  
2s. 9d. per Hat.

These

## 152 The Use of Decimals in Exchange.

l. s. d.  
Then from 5— 2—8  
Take 4—13—4

l.  
And from 110  
take 100

Remains 0— 9—4 the Gain, at the Rate of 10 l. per C.

The *Converse* of this needs no Example.

*Question 4.* If I buy  $5\frac{1}{2}$  Loads of Wheat for 45 l. 16 s. 8 d. For how much must I sell it per Quarter, to gain 6 l. 10 s. by the Bargain?

		l. s. d.
First	}	To the given Price = 45—16—8
		Add the designed Gains = 6—10—0
		The Sum is = 52—6—8

for which the said Wheat must be sold.  $5\frac{1}{2}$  Load = 27,5 Quarters.

Therefore say  $Qrs. \quad l. \quad Q. \quad l. \quad l. \quad s. \quad d.$   
 Therefore say 27,5 : 52,8 :: 1 : 1,903 = 1—18—0 $\frac{1}{2}$   
 the Answer.

These being the *principal Cases* of this Rule, are sufficient if well understood; and the Operations at large are omitted for the Exercise of the Ingenious.

## Exchange.

Both the *Name* and *Eufiness* of *Exchange* is *analogous* to that of *Barter*; only that relates to *Goods* and *Commodities*; whereas this is concern'd in *Foreign Coins*, *Weights*, and *Measures*.

*Exchange* then consists in finding the *true Sum* or *Value* of one *Country Coin*, &c. *equivalent* to any given *Sum* or *Value* of that of any *other Country*.

The *Par* of *Exchange* is the *fixt* and *Standard Value* of *Foreign Coins*, &c. express'd in *Sterling Money* of our own; and is that in the *Tables*. 'Tis so called because in *Exchange*, *Par pro Pari*, i. e. One equal Value for another, is given.

The *Course* of *Exchange* is the *current Price* of *Exchange*, always unsettled, being sometimes *above* and sometimes *below* the *Par*; according to the various *Circumstances* and *Accidents* of *Trade* and *Nations*.

The

## Decimal Tables of Foreign Coins. 153

The *Course of Exchange* is published in the Weekly Papers and Pamphlets, which compar'd with the *Par* in the *Tables*, it appears whether it be above or below it at any Time.

### E X A M P L E.

<i>Course of Exchange.</i>		<i>The Par.</i>		<i>Difference.</i>							
		<i>s.</i>	<i>d.</i>	<i>s.</i>	<i>d.</i>						
} June 1733. at	<i>Amsterdam</i>	35	: 0	} <i>Sbil. d.</i>	-33	: 4	} <i>Pence.</i>	-1	: 8	} above.	
	<i>Rotterdam</i>	35	: 1		-33	: 4		-1	: 7		
	<i>Hamburgh</i>	34	: 1		-33	: 4		-0	: 7		
	<i>Antwerp</i>	35	: 4		-33	: 4		-2	: 0		
	<i>Madrid</i>	41	: 7		-54	: ½		-0	: 12½		} below.
	<i>Leghorn</i>	50	: 3		-54	: ½		-0	: 37		
	<i>Genoa</i>	53	: 1		-54	: ½		-0	: 0½		
<i>Venice</i>	48	: 7	-52	: ½	-0	: 3½					

It is to be observed, that when the *Course of Exchange* is above the *Par*, tis a general Indication that our Trade is *prosperous*, and the Nation on the *Gainful Side*; as on the contrary, if tis *below the Par*, the *Trade* is *bad*, and the Nation *looser*.

The *Par of Exchange* in *Coins, Measures, Weights, &c.* between Us and Foreigners, are express'd in the following *Tables*, and which I have reduced to *Decimals* for more convenient and ready resolving of *Questions* in this Rule.

7	1,87910	,532150	38.0	1,9	,526315
8	1,883	,530973			

From these Sets of Tables of the *Par* and *Course* of *Exchange*, (which are more complete than any I have yet seen in the *Common Books* of *Arithmetick*;) the ingenious Accomptant will readily cast up any *Bill of Exchange*; or convert the *Coins, Weights* and *Measures* of any other Country into the *same* of our own. And by comparing the *Course* with the *Par*, may see whether our *Nation Gains* or *Loses* by trading to any *Foreign Parts*, and in what *Proportion*.

*Question 1.* Suppose at *Venice* I would exchange 175*l.* 12*s.* 6*d.* for their *Ducats de Banco* at 4*s.* 4*d.* per *Piece*, How many must I have?

*l. s. d. l. s. d. l.*  
First, 175—12—6 = 175,625; and 4—4 = 210.

Then

,210	175,625	Ducats	}	The Answer,
21	175625			
,195	158,0625	(759,3		
	1365	ferc. }		
	1156			
	975			
	1812			
	1755			
	575			

*Question 2.* The *Course of Exchange* at *Madrid* being now 41  $\frac{1}{4}$  *d.* per *Piece* of 8 *Mexico*, what Number of those *Pieces* may I have in exchange for 533,766*l.*?

Per Table the First, of the *Course of Exchange* 41  $\frac{1}{4}$  *d.* = ,1744*l.*

Then ,1744 533,766 (=3060 Pieces, the Answer.

*Quest-*

'The Use of Decimals in Exchange. 159

**Question 3.** A Bill of Exchange was accepted at London for the Payment of 933,93*l.* for the same value delivered at Lisbon in Milrees; Exchange at 5*s.* 4*d.* per Piece. How many of those Milrees was paid at Lisbon?

First 64*d.* (= 5*s.* 4*d.*) = 26*l.*

Then 26) 933,93 (= 3502,25 Milrees, the Answer.

Now had these 3502,25 Milrees been exchanged at Par (viz. 6*s.* 8½*d.*) they would have amounted to 1174,6895*l.* which is above 240*l.* more; and consequently there was so much loss.

**Question 4.** In 1421 Pieces of 8 Peru, How many English Pounds Sterling, Exchange as Par?

Multiply — 1421  
By the Par = 22082

9) 4263

4730

11368

28420

2842

Answer *l.* 313,80410

Another Way.

}	For	1 =	0,22082
		20 =	4,41666
		400 =	88,33333
		1000 =	220,83333
		1421 =	313,80410

**Question 5.** When the Exchange from Antwerp to London is at 1*l.* 4*s.* 7*d.* (= 34*s.* 7*d.*) Flemish; How many Pounds English at London will ballance 236*l.* Flemish at Antwerp?

Proceed thus,  $\left\{ \begin{array}{l} \text{Multiply the Tabular Num-} \\ \text{ber for English Pounds} \\ \text{By the given Number} \end{array} \right. \begin{array}{l} 57831, \text{ Sc.} \\ - 236 \\ \hline \end{array}$   
The Product is the Answer *l.* 136,4819, Sc.

**Question 6.** What Number of Flemish Pounds will be equivalent to 400*l.* Sterling, Exchange at 1*l.* 13*s.* 6*d.* (= 33*s.* 6*d.*)?

Multiply the Pound Flemish 1,675  
By the Number of Pounds Sterling 400

The Product is the Answer = 670,000 Pounds Sterl.

**Question 7.** A Dutch Man sells 2950 Flemish Ells of Holland to an English Man, a Spaniard, a Venetian, an Italian, and

## 160 *The Use of Decimals in Alligation*

and a *Portuguese*; who are to have each a like Quantity; *Quere* how much in their own Country Measure?

First 2050 *Flemish Ells* are equal to 1230 *Ells English*, equal to 4612,5 Feet, which divided by 5 quotes 922,5 Feet each.

Then by the	{	307,5	Yards for the <i>Briton</i> .	}	
Table of Measure	{	793,89	Feet for the <i>Venetian</i> .	}	
922,5 Feet are e-	{	1228,36	Palms for the <i>Spaniard</i> .	}	} Anf.
qual to	—	482,2	<i>Braces</i> for the <i>Ita'ian</i> .	}	
		335,43	<i>Vares</i> for the <i>Portuguese</i> .	}	

*Question 8.* What Number of *Pounds Averdupois* at *Vienna* will *Equiponderate* 270 *Pounds Averdupois Weight* at *London*?

Divide 270 by ,83. the Quotient 325,37. is the Answer.

But if 'twas required to know what Number of *Pounds Averdupois Weight* at *London* would equal any given Number at any other place, then you must multiply by the *Tabular Number*.

### Alligation, or Rule of Composition.

*Alligation* (so called of the Latin Word *Alligo*, to bind or tie together; because the vulgar Way is to tie or connect together the Numbers concern'd in the Work,) is a Rule for (compounding or Mixing several Ingredients of different Sorts together, in any Manner or Proportion. And is divided into *Alligation, Medial* and *Alternate*.

*Alligation Medial* is that by which the Mean Rate or Price of any Mixture is found when the particular Quantities, and their Prices, are given; and it is perform'd by this

#### Rule,

Multiply each Quantity by its Price; then say, As the Sum of all the Quantities, is to the Sum of the said Products, so is any Part of the Mixture, to the Mean Price of that Part.

*Question 1.* A *Tobacconist* would mix 20 lb. of *Tobacco* at 9 d. the Pound with 60 lb. at 14 d. per lb. with 40 lb. at 18 d. per lb. and with 12 ½ lb. at 2 s. per lb. *Quere* what a Pound of such a Mixture is worth?

First

The Use of Decimals in Alligation. 161

	lb.	Rate.	Product.	Products.	
First,	}	20 X, 0375	produceth	—	0,75
		60 X, 0583	produceth	—	3,5
		40 X, 075	produceth	—	3,0
		12,75 X, 1	produceth	—	1,275

The Sum 132,75 of the Quan. The Sum 8,525 the Prod.

Then say, As 132,75 : 8,525 :: 1 : 0642  
 132,75) 8,5250 (0,0642 = 1 s. 3 1/4 d. per lb. Answer.

Answer 4 l. 5 s. 7 1/4 d. Allt.

Y

## 162 The Use of Decimals in Alligation.

*Alligation Alternate* is that by which the *particular Quantities* of every Ingredient in any *Mixture* are found; when the *particular Rates* of every one of the Ingredients; and the *Mean Rates* are given.

This is (as it were) the *Converse* of the former, and admits of *three Cases*.

*Case 1.* The *particular Rates* and the *Mean Rate* being given, to find the *Quantity* of each Ingredient for the *Mixture* proposed.

*Question 1.* A *Vintner* would make a *Mixture* of *Malaga* at 7 s. 6 d. per Gallon; with *Canary* at 6 s. 9 d. per Gallon; *Sherry* at 5 s. per Gallon, and *White Wine* at 4 s. 3 d. per Gallon: What *Quantity* of each Sort must he take, that the *Whole Measure* may be sold for 5 s. 10 d. per Gallon?

*Note,* In all Questions of this Nature, where two or four Things are mixt together, when *one half* of the Prices are *Greater*, and the *other half* *lesser* than the *Mean Rate*, you must set a *greater* and *lesser* Price *above*, and the same *below* the *mean Price*; then take the *Difference* between the *mean Rate* and the *particular Rates*, and place them *alternately*, and they will be the *Quantities* requir'd.

	<i>Rates.</i>	<i>Differences.</i>
	7,5	1,583
	4,25	1,6
Mean Rate = 5,83	5	0,916
	6,75	0,83

The Sum of those Differences is = 5,0 Gallons the whole Mixture.

*Note,* The *Differences* are not only the *Quantities*, which answer the Question, but *any other Numbers*, in the *same Proportion* as they are, will answer the Question as well.

For	1,583	1,6	0,916	0,83
All multiplied by	—	—	—	3
Produce the Proportionals	4,75	5	2,75	2,5
These multiplied by	—	—	—	4
Produce these whole Numbers in the same Ratio; and so on <i>In infinitum</i> .	19.	20.	11.	10.

In *Case* one of the *Given Rates* (when more than two) be *Greater* and all the rest *Lesser* than the *mean Rate* } *Greater* } and all the rest *Lesser* } than the *mean Rate* } *Then*

*The Use of Decimals in Alligation. 163*

Then the *mean Rate*, *particular Rates*, and *Differences* must stand as in the following Examples.

	<i>P. R. Differences.</i>		<i>P. R. Differ.</i>
<i>Mean Rate</i> 20	$\left. \begin{array}{l} 18 \quad 4 + 2 \\ 22 \quad 2 \\ 24 \quad 2 \end{array} \right\}$	<i>Mean Rate</i> 20	$\left. \begin{array}{l} 14 \quad 4 \\ 18 \quad 4 \\ 24 \quad 6 + 2 \end{array} \right\}$

	<i>R. Differences.</i>		<i>R. Differences.</i>
<i>M. Rate</i> 4	$\left. \begin{array}{l} 2 \quad 1 + 5 + 13 \\ 5 \quad 2 \\ 9 \quad 2 \\ 17 \quad 2 \end{array} \right\}$	Or 40	$\left. \begin{array}{l} 10 \quad 8 \\ 25 \quad 8 \\ 36 \quad 8 \\ 48 \quad 30 + 15 + 4 \end{array} \right\}$

The Method is the same for any other given Rates, or Prices.

*Case 2.* When the *Particular Rates*, the *Mean Rate*, and the *Quantity* of one Ingredient is given; to find the *Quantity* of all the rest of the Ingredients.

This is call'd *Alligation Partial*; because a *Part* of the Mix'd Ingredients only are known.

In this Case you must set down the *mean Rate*, the *particular Rates*, and their *Differences* just as before; then say, Rule.

*As the Difference opposite to the known Quantity, is to the known given Quantity; so is any other Difference, to the Quantity of its opposite Name.*

*Question 2.* How much *Malaga* at 7 s. 6 d.; *Sherry* at 5 s.; *White Wine* at 4 s. 3 d. the Gallon, must be mixt with eighteen Gallons of *Canary* at 9 s. 9 d. per Gallon, that the Whole may be sold for 5 s. 10 d. per Gallon?

	<i>Rates.</i>		
<i>Mean Rate</i> 5,83	$\left. \begin{array}{l} 7,5 \quad \text{Malaga} \\ 5 \quad \text{Sherry} \\ 6,75 \quad \text{Canary} \\ 4,25 \quad \text{White} \end{array} \right\}$	$\left. \begin{array}{l} 0,83 \\ 1,6 \\ 1,583 \\ 0,916 \end{array} \right\}$	<i>Differences.</i>

Then, As 1,583 : 18 ::  $\left. \begin{array}{l} 0,83 \text{ to the Gallons of Malaga.} \\ 1,6 \text{ to the Gallons of Sherry.} \\ 0,916 \text{ to the Gallons of W. Wine.} \end{array} \right\}$

I leave the Work to exercise the Learner.

164 *The Use of Decimals in Alligation.*

*Case 3.* The particular Rates, the mean Rate, and the Sum of all the Quantities of the Ingredients given; hence to find the particular Quantities of the Mixture.

This is call'd *Alligation Total*; because the whole Quantity of the Mixture is given.

It is thus perform'd; set down the mean Rate, the particular Rates; and find their Differences as before. Then say,

Rule. As the Sum of all the Differences, is to the Sum of all the Quantities; so is each particular Difference, to its particular Quantity.

*Question 3.* Suppose it required to mix Malaga at 7 s. 6 d. with Canary at 6 s. 9 d. Sherry at 5 s. and White Wine at 4 s. 3 d. per Gallon; and the whole Quantity to be 84½ Gallons, and to be sold at 5 s. 10 d. per Gallon; Quere the Quantity of each Sort for the Mixture?

Mean Rate	5,83	}	7,5	Malaga	}	0,83	}	Differences.	
			5	Sherry	}	1,6			
			6,75	Canary	}	1,583			
			4,25	White	}	0,916			
							5	= The Sum.	

Then, As 5 : 84,625 ::	}	0,83	Malaga.	}	to the Quantity in Gallons of
		1,6	Sherry.		
		1,583	Canary.		
		0,916	White.		

*Note;* The Work of these, and such like Proportions, may be very much shortened, and easierly perform'd by a common Multiplier as in Fellowship.

Now because *Alligation alternate* answers not Questions compleatly, that is, does not give all the Answers such Questions are capable of; and so perhaps not always those which best suit the occasion; I shall shew (from Mr. Ward) how this Imperfection of common Arithmetick is supplied by Algebra, and all the possible Answers to any Questions may be clearly and easily discover'd.

*Question 4.* A Tobacconist hath three Sorts of Tobacco, viz. one of 2 s. 8 d. per Pound; another of 20 d. per Pound; a third sort of 16 d. per Pound; of these he would make a Mixture to contain 56 Pound that may be sold for 22 d. per Pound; How much of each Sort may he take?

The Use of Decimals in Alligation. 165

Let  $\left\{ \begin{array}{l} a = \text{the Quantity of that worth } 2 \text{ s. } 8 \text{ d.} = 32 \text{ d.} \\ e = \text{that of } 20 \text{ d. per Pound.} \\ y = \text{that of } 16 \text{ d. per Pound.} \end{array} \right.$

Then	1.	$a + e + y = 56$	Hence 'tis evident from the 7th Step that the Quantity signified by $a$ must be less than 21, and (by the 8th) Step greater than $9\frac{1}{2}$ . That is $a$ may be any Number between 21 and $9\frac{1}{2}$ .
And	2.	$32a + 20e + 16y = 1232$	
$1 - a$	3.	$e + y = 56 - a$	
$2 - 32a$	4.	$20e + 16y = 1232 - 32a$	
$3 \times 16$	5.	$16e + 16y = 896 - 16a$	
$4 - 5$	6.	$4e = 336 - 16a$	
$6 \div 4$	7.	$e = 84 - 4a$	
$3 - 7$	8.	$y = 3a - 28$	

If there be more than three Quantities concerned in the Question, the Work will be more large; because the Limits of all the Quantities above two, must be found.

Question 5. Suppose it were required to mix four Sorts of Wine together; viz. one worth 7 s. 4 d. per Gallon; a second worth 4 s. 7 d. a third worth 3 s. 8 d. and a fourth worth 2 s. 9 d. per Gallon. How much of each Sort must be taken to make a Mixture of 63 Gallons, to be sold for 5 s. 6 d. per Gallon, without Loss?

			s.	d.	d.
First let	}	$a =$ that Quantity worth	7	4	$= 88$
		$e =$ that worth	4	7	$= 55$
		$y =$ that worth	3	8	$= 44$
		$u =$ that worth	2	9	$= 33$
		the mean Rate	5	6	$= 66$

Then	1.	$a + e + y + u = 63$
And	2.	$88a + 55e + 44y + 33u = 4158$
$1 - a$	3.	$e + y + u = 63 - a$
$2 - 88a$	4.	$55e + 44y + 33u = 4158 - 88a$
$3 \times 33$	5.	$33e + 33y + 33u = 2079 - 33a$
$4 - 5$	6.	$22e + 11y = 2079 - 55a$
$6 \div 11$	7.	$2e + y = 189 - 5a$
$3 \times 55$	8.	$55e + 55y + 55u = 3465 - 55a$
$8 - 4$	9.	$11y + 22u = 33a - 93$
$9 - 11$	10.	$y + 2u = 3a - 63$
Suppose	11.	$a = 22$ . Then $5a = 110$ , and $3a = 66$
for 7th	12.	$2e + y = 189 - 5a = 79$

166 *The Use of Decimals in Position.*

$$\begin{array}{l|l}
 12-2e & 13 \mid y = 79 - 2e \\
 \text{Per 3d.} & 14 \mid e + y + u = 63 - a = 41 \\
 14-e & 15 \mid y + u = 41 - e \\
 15-13 & 16 \mid u = e - 38
 \end{array}$$

From the seventh and tenth Steps it appears, that the Quantity denoted by  $a$ , must be less than  $37\frac{1}{2}$ , and greater than 21 Gallons; whence 16 answer flow from the Limits of  $a$  only. Then if  $a$  be put = 22, by the thirteenth and sixteenth Steps it appears  $e = 39$ .  $y = 1$ , and  $u = 1$ . And thus proceeding with each single value of  $a$ , above 120 Answers may be found to this Question in whole Numbers; in Fractions, infinite.

*Position, or Rule of False.*

This Rule of *Position*, or rather *Supposition*, is so call'd, because we *suppose* or make a *Position* of some *uncertain* Numbers, in order that by reasoning from them we may gain the *true Number* sought; and because those *Positions* are altogether at *random* or *adventure*, the *Rule* is also call'd *False*.

The Use of this *Rule*, before the common Knowledge of *Algebra*, was much more considerable than since; because that Art supplies *Theorems* for resolving all kind of Questions in this Rule in a better and more curious a manner than here; Yea some of the *best Pieces* of *Arithmetick* have intirely discarded it, and others post-ponē it, as *obsolete* and of little use, since *Algebra*.

Questions in this are mostly perform'd by one or two *Suppositions*; if by one, the Rule is said to be of *Single Position*; if two *Suppositions* are necessary, 'tis called *Double Position*.

*Single Position.*

*Question 1.* Three Merchants  $A$ ,  $B$ ,  $C$  trade in Company, and gain 100  $l.$  of which  $A$  had a certain Part,  $B$  had twice as much, and  $C$  had thrice as much as  $B$ ; How much had each Man?

Suppose  $A$  had 4  $l.$  then  $B$  must have 8  $l.$  and  $C$  would have 24  $l.$  which together make 36  $l.$  but shou'd have been an 100  $l.$

There-

Therefore Reason by Proportion  $l.$

$$\text{Thus, As } \overset{l.}{36} : \overset{l.}{100} :: \left\{ \begin{array}{l} 4 : 11, x = A \\ 8 : 22, x = B \\ 24 : 66, x = C \end{array} \right.$$

Their several Parts added make —  $\frac{100}{100}$  for Proof.

*Question 2.* A Schoolmaster being asked how many Scholars he had; answer'd, if I had as many, and  $\frac{1}{2}$  as many, and  $\frac{1}{4}$  as many, I should have 99. How many had he?

Suppose he had 40; Then  $40 + 40 + 20 + 30 = 130$ , but it should have been but 99. Therefore say

As  $130 : 40 :: 99 : 36$  Scholars, the Answer.

*Question 3.* Three Men *A, B, C* buy a Ship for 310 *l.* 15 *s.* of which *A* paid an unknown Sum; *B* paid  $2\frac{1}{2}$  as much; and *C*  $3\frac{1}{3}$  as much: How much did each Man pay?

Suppose *A* paid 48 *l.* then *B* paid  $48 \times 2,5 = 120$  *l.* and *C* must pay  $48 \times 3,3 = 160$  *l.* But  $48 + 120 + 160 = 328$  instead of 310,75 *l.*

Say therefore, As  $328 : 48 :: 310,75 : 45,4756$ , &c.

Then <i>A</i> paid	—	—	45,4756
<i>B</i> paid ( $45,4756 \times 2,5 =$ )			113,689
<i>C</i> paid ( $45,4756 \times 3,3 =$ )			151,5853
Proof is the Sum	—		310,75

### Double Position.

In the *Double Rule*, two Suppositions are used, because here the Numbers cannot be parted to find the Answer by Proportion as before.

Therefore when we make two Suppositions, and miss in both, observe the Nature of the Errors, whether they be Greater or Lesser than the Number proposed; and accordingly mark them with the Signs More or Less, viz. +, —; and place them precisely against their proper Suppositions; then observe the general

Rule,

# 168 The Use of Decimals in Position.

## Rule,

Viz. As the Difference of the Errors if alike, (or their Sum if unlike) is to the Difference of the Suppositions; so is either of the Errors, to a fourth Number.

The fourth Number add to, or subtract from, the Supposition opposite to it; and you have the Number sought.

*Question 1.* Admit three Merchants build a Ship which cost 1360 Pounds. A pays a certain Part unknown; B paid  $2\frac{1}{2}$  as much, wanting 15,5 *l* and C paid as much as both A and B, and 75,25 *l*. over; How much did each Man pay?

First, Suppose A paid 200 *l*. then B must have paid 484,5 *l*. and C paid 759,75 *l*. But those three Sums, viz. 200 + 484,5 + 759,75 = 1444,25 *l*. which is more than 1360 by 84,25 *l*. Wherefore the first Error is — + 84,25 *l*.

Secondly, Suppose A paid 180 *l*. then B paid 434,5 *l*. and C paid 689,75 *l*. But 180 + 434,5 + 689,75 = 1304,25 *l*. which is too little by 55,75 *l*. therefore the Suppositions and their Errors will stand thus;

The First Supposition	200, +	84,25 Error.	
The Second Supposition	180, —	55,75 Error.	
The Difference of Supposi.		= 20	140 = Sum of Errors.

Then by the General Rule, say,

$$\begin{array}{l} \text{As, } \left\{ \begin{array}{l} 140 : 20 :: 55,75 : 7,964 \text{ } \mathcal{E}. \\ \text{Or, } \left\{ \begin{array}{l} 140 : 20. : : 84,25 : 12,035 \text{ } \mathcal{E}. \end{array} \right. \end{array} \right. \end{array}$$

Then,  $\left\{ \begin{array}{l} 200 - 12,035 = \\ 180 + 7,964 = \end{array} \right. \left. \begin{array}{l} \\ \\ \end{array} \right\} 187,964 = A's \text{ Part.}$

Then B must have paid — 454,410 = B's Part.

And C must have paid — 717,624 = C's Part.

The Sum of which is = 1360 for Proof.

*Nota.* When the Errors are equal and have unlike Signs; half the Sum of the Suppositions, is the Number sought.

Ex-

Extraction of Roots.

The *extream Use of Decimals* in all kinds of *Extractions* is sufficiently known to all versed in *Arithmetical Knowledge*; and its *absolute Necessity* in some Parts, of *Arithmetick*, and its *Excellency* beyond even *Logarithms* themselves in others, is also as well known.

I would know what is the *Square Root* of 161,29?

Thus            161,29 (12,7 = the Answer.

$$\begin{array}{r}
 \phantom{22)} 161,29 \\
 \underline{\phantom{22)} 144} \\
 247) 1729 \\
 \underline{\phantom{247)} 1729} \\
 \phantom{247)} \dots
 \end{array}$$

What is the *Square Root* of 3477?

In such Cases as this, you must add *twice* as many *Cyphers* to the given Number, as you design to have *Decimal Places* in the *Root* of the above Number to three Places of *Decimals*.

Then            3477,000000 (58,881 the Root requir'd.

$$\begin{array}{r}
 \phantom{108)} 3477,000000 \\
 \underline{\phantom{108)} 25} \\
 108) 977 \\
 \underline{\phantom{108)} 864} \\
 1168) 10300 \\
 \underline{\phantom{1168)} 9344} \\
 11768) 95600 \\
 \underline{\phantom{11768)} 94144} \\
 117761) 145600 \\
 \underline{\phantom{117761)} 117761} \\
 27839
 \end{array}$$

179 *The Use of Decimals in Extractions.*

Required the *Square Root* of 2, to 6 Places of Decimals.

2.0000000000 (1.414213 the Root required.)

$$\begin{array}{r}
 1 \\
 \hline
 24) 160 \\
 \underline{96} \\
 281) \dots 400 \\
 \underline{281} \\
 2824) 11900 \\
 \underline{11296} \\
 2828) \dots 604 \\
 \underline{565} \\
 \dots 38 \\
 \underline{28} \\
 \dots 10 \\
 \underline{8} \\
 \dots (2)
 \end{array}$$

Having here got 3 Places of the 6, I work by the *contracted way of Division*, and gain the other 3 as truly as if wrought at large.

What is the *Square Root* of 4489?

4489 (67 the Root requir'd.)

$$\begin{array}{r}
 36 \\
 \hline
 127) 889 \\
 \underline{889} \\
 \dots
 \end{array}$$

What is the *Square Root* of .00576?

.00576 (.024 the Root sought.)

$$\begin{array}{r}
 004 \\
 \hline
 044) \dots 176 \\
 \underline{176} \\
 \dots
 \end{array}$$

What

172 *The Use of Decimals in Extractions.*

To Extract the Square Root of Compound Repetends.

What is the Square Root of  $198,8\dot{s}$ ?

Thus,  $198,8\dot{s}$  ( $14,0305686\dot{s}$  the Root.

$$\begin{array}{r}
 \text{I} \\
 \hline
 24) \cdot 96 \\
 \underline{\phantom{24}96} \\
 2803) \cdot \cdot 8568 \\
 \underline{\phantom{2803}8409} \\
 280605) \cdot 1595685 \\
 \underline{\phantom{280605}1403025} \\
 280611) 192660 \\
 \underline{\phantom{280611}168366} \\
 \phantom{280611) \cdot} 24294 \\
 \phantom{280611) \cdot} \underline{22448} \\
 \phantom{280611) \cdot} \phantom{22448} 1846 \\
 \phantom{280611) \cdot} \phantom{22448} \underline{1683} \\
 \phantom{280611) \cdot} \phantom{22448} \phantom{1683} 163 \\
 \phantom{280611) \cdot} \phantom{22448} \phantom{1683} \underline{140} \\
 \phantom{280611) \cdot} \phantom{22448} \phantom{1683} \phantom{140} \cdot 23 \\
 \phantom{280611) \cdot} \phantom{22448} \phantom{1683} \phantom{140} \underline{22} \\
 \phantom{280611) \cdot} \phantom{22448} \phantom{1683} \phantom{140} \phantom{22} (1)
 \end{array}$$

In this Manner the *skilful Artist* may proceed and gain the Root of any *Repetend* to what Number of Places he pleaseth. I omit the *Extraction* of the *Cube Root* here; because I shall have occasion to shew the Method and *Rationale* of that, and of the *Square Root*. both, when I come to shew the Use of Decimals in Algebra.

## C H A P. IX.

*The Use of DECIMALS in the Business of Interest both Single and Compound ; Of Annuities, Pensions, &c. their Value in Present Worth, and in Arrears ; Of Rebate or Discount ; Of Free-hold or Real Estates.*

**I**NTEREST is a small Sum of Money paid for the Use of any greater Sum, according to any Rate agreed on; as 5 l. per 100 l. &c. for a Year; and it is either *Simple* or *Compound*.

*Simple Interest* is that which ariseth only from the *Principal* or Sum of Money lent; and both *Interest* and *Principal* are always the same as at first.

*Compound Interest* is that which ariseth from the *Principal* and its *Simple Interest* (when *due* and *forborn*) reckoned together as a *New Sum*, so that both *Principal* and *Interest* here are always increasing.

*Annuities, Pensions, Salaries, &c.* are *Rents, Profits, and Payments* made *Yearly, or Half Yearly, &c.* and they are said to be in *Arrears*, when they are due and unpaid for any Number of Payments.

*Rebate or Discount* is an *Abatement* of Part of a Sum of Money due sometime hence, in Consideration of *prompt* or present Payment of the Remainder; and this is done at any Rate of Interest.

In exemplifying the wonderful Use of Decimals in the *Affair of Interest, &c.* I need only shew the Reader the Solutions of those *admirable Theorems* in Numbers at large, which Mr. Ward (in his *Mathematician's Guide*) has with *great Invention* contriv'd from the following *Data*, and Method of Reasoning from thence.

*In Simple Interest.*

He puts  $\left\{ \begin{array}{l} P = \text{Any Principal or Sum put to Interest.} \\ R = \text{The Ratio of the Rate per Cent. per Annum.} \\ T = \text{The Time of the Principal at Interest.} \\ A = \text{The Amount of the Principal and its Interest.} \end{array} \right.$

*In Annuities, &c. at Simple Interest.*

He puts  $\left\{ \begin{array}{l} U = \text{The Annuity, Pension, or Yearly Rent, &c.} \\ T = \text{Time of Forbearance, or being Unpaid.} \\ R = \text{The Ratio of Interest, as before.} \\ A = \text{The Amount of the Annuity and its Interest,} \\ \frac{2}{R} - 1 = n \text{ By way of Substitution, in Arrears.} \\ \frac{2}{R} - \frac{2P}{U} + 1 = n \text{ By Substitution also, in pref. worth.} \\ P = \text{The Present Worth of Annuities, &c.} \end{array} \right.$

In *Compound Interest* these Characters signify the same Things as here; only  $T$  here, is there wrote in a small Letter ( $t$ ) and denotes the *Power* of  $R$ ; or is the *Index* of the Power to which  $R$  is to be involved; and  $R =$  Amount of 1*l.* and its Interest one Year. From the above *Data*, he makes the following Proportions.

*Simple Interest.*

The Ratio of the Rate of Interest signified by  $R$  is thus found (for 'tis only the Interest of 1*l.* for 1 Year.)

	<i>l.</i>	<i>sh.</i>	<i>d.</i>	<i>Ratio.</i>	
As $\left\{ \right.$	100	: 4		:: 1 : ,04	= $R$ at 4 per Cent.
	100	: 45		:: 1 : ,045	= $R$ at 4 $\frac{1}{2}$ per Cent.
	100	: 5		:: 1 : ,05	= $R$ at 5 per Cent.
	100	: 55		:: 1 : ,055	= $R$ at 5 $\frac{1}{2}$ per Cent.
	100	: 6		:: 1 : ,06	= $R$ at 6 per Cent.

And  $\left\{ \begin{array}{l} 1. 2. 3. 4. 5. 6. \&c. = \text{Years.} \\ R. 2R. 3R. 4R. 5R. 6R. \&c. = \text{Interest.} \end{array} \right.$

Hence 'tis evident the *Simple Interest* of  $r*l.*$  is a *Series* of *Terms* in *Arithmetical Progression* increasing.

Wherein  $\left\{ \begin{array}{l} R = \text{The first Term, and also the Common Differ.} \\ T = \text{The Number of all the Terms.} \\ TR = \text{The last Term of the Series.} \end{array} \right.$

Then

I. Int.

Then, As  $1 : TR :: P : TRP =$  Interest of  $P$ . But the Principal and its Interest added is equal to the Amount. Whence this General Theorem,

$$TRP = P = A.$$

Annuities, Simple Interest.

Here  $U =$  the Yearly Rent, and  $R =$  the Ratio of Interest. Then  $2U =$  the Rent, and  $RU =$  the Interest for the second Year; and thus the following Progressions for five Years.

$$\text{Thus } \left\{ \begin{array}{l} 1. \quad 2. \quad 3. \quad 4. \quad 5. \quad \text{\&c. The Years.} \\ U. \quad 2U. \quad 3U. \quad 4U. \quad 5U. \quad \text{\&c. The Rent.} \\ RU. \quad 2RU. \quad 3RU. \quad 4RU. \quad \text{\&c. The Interest.} \end{array} \right.$$

Hence 'tis plain, that  $RU + 2RU + 3RU + 4RU + 5U = A$ . The Sum of all the Rents and their Interests being forborn five Years. From whence it follows

That  $RU + 2RU + 3RU + 4RU = A - TU$ . For here  $T=5$ .

Divide all by  $U$ . Then  $R + 2R + 3R + 4R = \frac{A - TU}{U}$

Then by Substitution, put  $R + 2R + 3R + 4R = Z$ .

Then  $1 + 2 + 3 + 4 = \frac{Z}{R}$  Now the first and last Terms

of the Progression are  $1 + 4 = 5 = T$ . Therefore  $\frac{T-1}{2} \times T =$  Sum of all the Terms.

Now  $\frac{T(T-1)}{2} = \frac{Z}{R}$  Hence  $\frac{TTR - TR}{2} = Z$ . Con-

sequently  $\frac{TTR - TR}{2} = \frac{A - TU}{U}$  The General Theorem

for Annuities in Arrears.

But because  $P =$  the Present Worth, is not in the last General Theorem, That will answer no Questions relating thereto; Wherefore a New one must be contriv'd: Now because  $A$  denotes the same Thing, viz. the Amount, in both the last General Theorems; and because any two Quantities, equal to one and the same thing, are equal to one another. And  $PTR + P = A$  in the first General Theorem; And  $\frac{TTRU - TRU + 2TU}{2} = A$  in the latter General Theor.

There-

476 *The Use of Decimals in Interest,*

Therefore  $PTR + P = \frac{TTRU - TRU + 2TU}{2}$  is the *General Theorem* for Questions about the *present Worth* or *Purchasing of Annuities*.

*Compound Interest.*

The *Proportion* for finding *R*, the *Ratio* of the *Rate* of *Compound Interest*, (which is only the *Amount* of 1 *l.* and its *Interest* for one *Year*;) is This

As  $\begin{cases} 100 : 105 :: 1 : 1,05 = R \text{ at } 5 \text{ per Cent.} \\ 100 : 106 :: 1 : 1,06 = R \text{ at } 6 \text{ per Cent, \&c.} \end{cases}$

But as *one Pound*, is to the *Amount* of *one Pound*, at *one Year's End*; so is that *Amount*, to the *Amount* of *one Pound* at *two Year's End*; and so on continually.

That is,  $1 : R :: R : RR :: RR : RRR :: R^3 : R^4 :: R^4 : R^5 :: \&c.$

Then  $\begin{cases} 1. 2. 3. 4. 5. = \text{Years.} \\ R. R^2. R^3. R^4. R^5. = \text{The Amount of } 1 \text{ l. at} \\ \text{any Rate.} \end{cases}$

Hence 'tis evident the *Amount* proceeds in a *Geometrical Proportion*, wherein the *Time* (= *t*), or *Number of Years*, is always equal to, or the same with, the *Index* of the *Power* of the *last* and *highest Term* of the *Series*; viz.  $R^t$ , or  $R^5$ .

But, as *one Pound* : is to the *Amount* of *one Pound* for *any given Time* :: so is *any proposed Principal* or *Sum* : to its *Amount* for the *same Time*.

That is, As  $1 : R^t :: P : PR^t$ .

But  $PR^t = A$  The *General Theorem*.

*Annuities. Compound Interest.*

Here  $\begin{cases} R = \text{One Pound and its Interest for one Year, as before.} \\ U = \text{The first Year's Rent without Interest.} \end{cases}$

Then  $RU =$  The *Amount* of the *first Year's Rent*, and its *Interest*.

And hence is form'd the following *Progression* of *Amounts* in continued *Geometrical Proportion*.

Thus  $\begin{cases} 1. 2. 3. 4. 5. \&c. \text{ The Years.} \\ U + UR + UR^2 + UR^3 + UR^4, \&c. \text{ The Amounts.} \end{cases}$   
Hence

*The Use of Decimals in Interest.* — 177.

Hence  $U + UR + UR^2 + UR^3 + UR^4 = A$  The Amount of any Yearly Rent or Annuity forborn five Years.

Now the last Term in the above Series is  $UR^4 = UR^{t-1}$ .

Therefore  $A - UR^{t-1} =$  The Sum of all the Antecedents.

And  $A - U =$  The Sum of all the Consequents in the Series.

So that it will be,  $U : RU :: A - UR^{t-1} : A - U$ .

Therefore  $AU - UU = RUA - UUR^t$ . Divide all by  $U$ .

Then  $A - U = RA - UR^t$ . The General Theorem.

For the present Worth, we must proceed as in Simple Interest in this Case, to gain an Equation or general Theorem, wherein shall be  $P$ .

The Theorem for Interest is  $PR^t = A$ .

And in the last Theorem  $\frac{UR^t - U}{R - 1} = A$ .

Consequently,  $PR^t = \frac{UR^t - U}{R - 1}$  The General Theorem.

*Free-hold Estates, Compound Interest*

*Free-hold* or *Real Estates* are supposed to be purchased for ever. And the *Computation* of the *Value* of such *Estates* is grounded on a *Series* of *Geometrical Proportionals* decreasing *ad Infinitum*.

Let  $P, U, R$ , denote the same as before; then the Series will be  $\frac{U}{R} \cdot \frac{U}{R^2} \cdot \frac{U}{R^3} \cdot \frac{U}{R^4} \cdot \frac{U}{R^5}$  (&c. till the last Term be  $= 0$ ). Then will  $P - 0 =$  Sum of all the Antecedents; and  $P - \frac{U}{R} =$  Sum of all the Consequents.

Therefore, as  $\frac{U}{R} : \frac{U}{R^2} :: P : P - \frac{U}{R}$  which gives  $PR - U = P$ . The general Theorem.

*Theorems Resolving all Questions concerning Simple Interest.*

Given  $P, R, T$ ; To find  $A$ ?

Theorem 1.  $TRP + P = A$ .

Given  $T, R, A$ ; To find  $P$ ?

Theorem 2.  $\left\{ \frac{A}{TR + 1} = P \right.$

A a

Given

178 *The Use of Decimals in Interest.*

Given  $A, P, T$ ; To find  $R$ ?

Theorem 3.  $\left\{ \frac{A - P}{TP} = R. \right.$

Given  $P, R, A$ ; To find  $T$ ?

Theorem 4.  $\left\{ \frac{A - P}{RP} = T. \right.$

*Question 1. What will 256 l. 10 s. Amount to in three Years, one Quarter, two Months, and eighteen Days, at 6 l. per Cent. per Ann.*

Here is given  $\left. \begin{array}{l} P = 256,5 \\ R = 0,06 \\ T = 3,46598 \end{array} \right\}$  To find  $A$ , per Tbe. 1.

Multiply	—	3,46598	= T
By	—	0,06	= R
—————			
Product	—	0,2079588	= TR
Mult. by Inversion	—	5,652	= P.
—————			
		4159176	
		1039794	
		124775	
		10397	
—————			

The Product — 53,34142 = TRP

Add — +256,5 = P

Answer — l. 309,84142 = A = 309 l. 16 s. 10 d.

*Question 2. What Principal or Sum of Money put to Interest, will raise a Stock of (or be worth) 405 l. 6 s. in five Years, and eight Months, at the Rate of 5 l. per Cent. per Ann.?*

Here is given  $\left. \begin{array}{l} A = 405,30016 \\ R = 0,05 \\ T = 5,613698 \end{array} \right\}$  To find  $P$ , per Tbe. 2.

Multi-

$$\begin{array}{r}
 \text{Multiply} \quad 5,613698 = T \\
 \text{By} \quad \quad \quad 0,05 = R \\
 \hline
 \text{Product} \quad 0,2806849 = TR \\
 \text{Add Unity} \quad 1, \\
 \hline
 TR + 1 = 1,2806849
 \end{array}$$

$$\begin{array}{r}
 405,30016(316,47144) = P. \\
 \underline{38420547} \\
 \cdot 2109469 \\
 1280684 \\
 \cdot 828785 \\
 \underline{768410} \\
 \cdot 60375 \\
 \underline{51227} \\
 \cdot 9148 \\
 \underline{8264} \\
 \cdot 184 \\
 \underline{128} \\
 \cdot 56 \\
 \underline{51} \\
 \underline{5} \\
 \underline{5}
 \end{array}$$

Hence the *Principal* is 316,47144 l. which, in common Coin, is 316 l. 9 s. 5 d. for the Answer.

*Note*, By this Theorem 'tis you find what *present Money*, or *prompt Payment*, will satisfy a *Debt* due any Time hereafter, *Abating* or *Discounting* at any *Rate per Cent*.

*Question 3.* At what *Rate of Interest per Cent.* will 36 l. amount to 36 l. 18 s. 11 d  $\frac{1}{2}$  d. in six Months, three Weeks, and three Days?

Here is given  $\left. \begin{array}{l} P = 36 \\ T = 526 \\ A = 36,9468 \end{array} \right\} \text{To find } R, \text{ per The. 3.}$

180 *The Use of Decimals in Interest.*

$$\begin{array}{r} \text{Multiply } 526 = F \\ \text{By } \quad \quad 36 = P \\ \hline 3156 \\ 1578 \\ \hline \end{array}$$

$$\begin{array}{r} \text{From } 36,9468 = A \\ \text{Subst. } 36, \quad = P \\ \hline 18,936,94680,05 = R \\ \quad \quad \quad 94680 \\ \hline \end{array}$$

Prod.  $18,936 = TP$

Then, As  $1 : 0,05 :: 100 : 5 l.$  Answer *5 per Cent.*

*Question 4.* In what Time will 200 l. 1 s. 8 d. amount to 250 l. at 4 l. 10 s. per Cent. Interest?

Here is given  $\left\{ \begin{array}{l} P = 200,083 \\ R = 0,045 \\ A = 250, \end{array} \right\}$  To find *T*, per *T* b: 4.

$$\begin{array}{r} \text{Molt. } 200,083 = P \\ \text{By } \quad \quad 0,045 = R \\ \hline 1000416 \\ 8002333 \\ \hline \end{array}$$

$$\begin{array}{r} \text{From } 250,000 = A \\ \text{Subst. } 200,083 = P \\ \hline \end{array}$$

$$\begin{array}{r} 9,00375) 49,91866(5,54399 = T \\ \underline{4501875} \end{array}$$

Prod.  $9,00375 = PR$

$$\begin{array}{r} 489791 \\ \underline{450187} \end{array}$$

The Time then is

Years  
5,54399 = 5 Years,  
7 Months, and 3  
Days.

$$\begin{array}{r} 39604 \\ \underline{36012} \end{array}$$

$$\begin{array}{r} 3592 \\ \underline{2701} \end{array}$$

$$\begin{array}{r} 891 \\ \underline{810} \end{array}$$

$$\begin{array}{r} 81 \\ \underline{81} \end{array}$$

Theorems resolving all Questions concerning Annuities, Penfions, &c. in Arrears, Simple Interest.

Given *U, T, R;* to find *A*?

Theorem 1.  $\frac{TTU - TU}{2} R + TU = A.$

Given

Given  $A, T, R$ ; To find  $U$ ?

Theorem 2.  $\left\{ \frac{2A}{TTR - TR + 2T} = U. \right.$

Given  $A, T, U$ ; To find  $R$ ?

Theorem 3.  $\left\{ \frac{2A - 2TU}{TFU - TU} = R. \right.$

Given  $U, R, A$ ; To find  $T$ ?

Theorem 4.  $\left\{ \sqrt{\frac{2A}{RU} + \frac{xx}{4}} - \frac{1}{2}x = T \right.$

Question 1. If 250*l.* Yearly Rent (or Annuity, &c.) be forborn or unpaid 7 Years; what will it amount to in that Time, at the Rate of 6*l.* per Cent. per Annum?

Here is given  $\left\{ \begin{array}{l} U = 250 \\ T = 7 \\ R = 0,06 \end{array} \right\}$  To find  $A$ , per Theorem 1.

Multiply	—	250	=	U	
By	—	7	=	T.	
		—————			
Product	—	1750	=	TU.	
By		7	=	T.	
		—————			
		12250	=	TTU.	
Subtract		1750	=	TU.	
		—————			
Remains		10500	=	TTU — TU.	
Halve		5250	=	TTU — TU ÷ 2	
Multiply by		0,06	=	R	
		—————			
Add		315,00			
		1750,	=	TU	
		—————			
Sum		2065 <i>l.</i>	=	A	The Answer.

If the Payment of the aforefaid Annuity had been made half Yearly, then would  $U = 125 = \frac{250}{2}$ , and  $T = 14 =$  Number of Payments; and  $R = 0,03 = \frac{0,06}{2}$ , and working as per Theorem;  $A$  will be found = 2091*l.* 5*s.* which is

182 *The Use of Decimals in Interest.*

is more than the *Yearly Payment* by 26 l. 5 s. Hence the *oftner* the *Payment*, the *more advantageous*.

*Question 2.* What *Annuity*, or *Yearly Payment*, being *unpaid* 8  $\frac{1}{2}$  *Years*, will raise a *Stock* of 572 l. 12 s. 8 d. at 5 *per Cent*, *per Annum*.

Here is given  $\left\{ \begin{array}{l} A = 572,63 \\ T = 8,5 \\ R = 0,05 \end{array} \right\}$  To find  $U$ , per *Theor. 2.*

Multiply — 8,5 = T  
By — ,05 = R

Again by — 4,25 = TR  
8,5 = T

2125  
3400

Product — 3,6125 = TTR

Subtract — 0,4250 = TR

Remains — 3,1875 = TTR - TR

Add 8,5 x 2 = 17,0000 = 2T

$TTR - TR + 2T = 20,1875$  l. (=U)  
 $1145,2666$  &c. = 2A (56,73148)

1009375  
1358916  
1211250  
147666  
141312

6056  
298  
201  
97  
80  
17  
16  
1

The Annuity there-  
fore is 56,73148 = 56 l.  
14 s. 7  $\frac{1}{4}$  d. The An-  
swer.

*Quest.*

*The Use of Decimals in Interest.* 183

*Question 3.* At what Rate of Interest, per Cent. per Ann. will 40 l. 13 s. 4 d. Yearly Rent, amount to 450 l. 13 s. 4 d. in 9 Years?

Here is given  $\left\{ \begin{array}{l} A = 450,8 \\ T = 9 \\ U = 40,8 \end{array} \right\}$  To find  $R$ , per Theorem 3.

Multiply  $\quad = 40,8 = U$

By  $\quad = 9 = T$

Product.  $\quad = 366 = TU$

Multiply again by  $\quad = 9 = T$

From that Prod.  $3294 = TTU$

Subtract  $\quad = 366 = TU$

Remains  $\quad = 2928 = TTU - TU$  The Divisor.

Then from  $901,8 = 2A$

Subtract  $\quad = 732 = 2TU$

Remains  $\quad = 169,8 = 2A - 2TU$  The Dividend.

Then  $2928 \overline{) 169,8} (0,05784 = R$

14640

• 2293

Therefore as  $1 \text{ l. } : 0,05784 :: 100 \text{ l. } : 5,784 = 5 : 15 : 8 \frac{1}{4}$   
the Rate per Cent. required.

*Question 4.* In what Time will 250 l. Yearly Rent, raise a Stock of 2065 l. allowing 6 per Cent. &c. for the Forbearance of the Payments as they become due?

Here is given  $\left\{ \begin{array}{l} U = 250 \\ A = 2065 \\ R = 0,06 \end{array} \right\}$  To find  $T$ , per Theorem 4.

First

184. *The Use of Decimals in Interest.*

First	—	4130	=	$2A$	
Then multiply	—	250	=	$U$	
By	—	0,06	=	$R$	
		15	=	$UR$	
Then	—	33,3	=	$\frac{2}{R}$	
And	$33,3 - 1$	=	$32,3$	=	$\frac{2}{R} - 1 = x$
And	$32,3 \div 2$	=	$16,15$	=	$\frac{1}{2} x$
The Square of it	is	$261,36x$	=	$\frac{1}{4} xx = \frac{xx}{4}$	
To which add		275,3	=	$\frac{2A}{RU}$	
The Sum is		536,694	=	$\frac{2A}{RU} + \frac{xx}{4}$	
The Square Root of which is	}	23,16	=	$\sqrt{\frac{2A}{RU} + \frac{xx}{4}}$	
From which take		16,15	=	$\frac{1}{2} x$	
There remains		7	=	$T$	The Time required, <i>viz.</i> 7 Years.

The *Divisions* and *Extractions* at large I have omitted for the *Learner's Exercise*; but I have represented all the Numbers in One; which Mr. *Ward's* Method could not do as being *deficient* in the *Doctrine of Calculating Numbers*, as may be observ'd in his Work of this and other Questions of Interest.

*N. B.* In all Questions about *Yearly*, or *stated Rents* and *Payments*, the *Interest* is reckoned for *every Payment* after it becomes *due*, thro' the whole Time of *Forbearance*.

Theorems resolving all Questions concerning the Present Worth of Annuities, Pensions, &c. at Simple Interest.

Given  $U, R, T$ ; To find  $P$ ?

 \text{Product } \text{---} 12,5 = U
 \end{array}$$

The Annuity then is 12,5*l.* = 12*l.* 10*s.* the Answer.

*Note,* This is a very frequent and useful Question; and ought to be work'd with great Exactness; and therefore if a Person be not very ready at, nor rightly understands the Manner of Contracted Multiplication and Division, 'twill be best to work the common Way. Which also is to be observed in all Questions of Moment.

*Question 3.* At what Rate of Simple Interest, will 250, *z* *l.* or 250*l.* 6*s.* 8*d.* purchase an Annuity of 30*l.* 10*s.* per Annum, to continue 10 Years?

$$\text{Here is given } \left. \begin{array}{l} P = 250, \text{ } z \\ U = 30, 5 \\ T = 10 \end{array} \right\} \text{To find } R, \text{ per Theorem 3.}$$

Multiply	—	30,5 = U	And 500,0 = 2P
By	—	<u>10 = T</u>	Also 610,0 = 2TU
The Product is	—	305 = TU	}
Which again mult. by	—	<u>10 = T</u>	
Produceth	—	3050 = TrU	} Differ. 109,3 = 2P — 2TU the Divi- dend.
From which take	—	<u>305 = TU</u>	
There remains		2745 = TTU - TU.	
Then	—	<u>5006,0 = 2PT</u>	
The Difference		2261,0 = TTU - TU - 2PT	
the Divisor.			

Then  $2261,0 \overline{) 109,3}$  } See Division of Repetends.  
 $2261 \quad 109$

$$\begin{array}{r}

 \end{array}$$

l. l.                      l. l.

Then say, As 1 : 0,04343 :: 100 : 4,343 = 4 l. 6 s.  
 10  $\frac{1}{4}$  d. the Rate *per Cent.* sought.

*Question 4.* In what Time will 7 l. *per Annum* pay a Debt of 120 l. 8 s. at 6 l. *per Cent.* Or, For how long a Time may an *Annuity* of 7 l. *per Annum* be purchas'd or enjoy'd for 120 l. 8 s. at the aforesaid Rate ?

Here is given  $\left. \begin{array}{l} U = 7 \\ R = 0,06 \\ P = 120,4 \end{array} \right\}$  To find T, *per Theorem 4.*

First

First	—	240,8 = 2P					
And	—	34,4 = $\frac{2P}{U}$					
From which take		<u>33,3 = <math>\frac{2}{R}</math></u>					
To the Remaind.		1,08 = $\frac{2}{R} - \frac{2P}{U}$					
Add Unity	—	1 = + 1					
The Sum is		2,08 = $\frac{2}{R} - \frac{2P}{U} + 1$ = * by Substitut.					
Then	—	1,03 = $\frac{1}{2}x$					
And	—	1,067 = $\frac{1}{2}xx$					
Again	—	0,42 = RU					
And	—	573,3 = $\frac{2P}{RU}$					
Then	—	574,4 = $\frac{2P}{RU} + \frac{xx}{4}$					
Sq. Root of that		23,98 = $\sqrt{\frac{2P}{RU} + \frac{xx}{4}}$					
To which add		<u>1,03 = <math>\frac{1}{2}x</math></u>					
The Sum is		24,9 = 25 = T the Time sought.					

Having thus, in a most perspicuous Manner, shew'd the *great and invaluable Service of Decimals* in working Questions of *Simple Interest*, &c. I shall proceed to treat of the same things, in the *like Manner*, in *Compound Interest*.

Theorems resolving all Questions of Compound Interest.

Given P, R, t; To find A?

Theorem 1.  $PR^t = A^2$

Given A, R, t; To find P?

Theorem 2.  $\left\{ \frac{A}{R^t} = P \right.$

Given  $\left\{ \begin{matrix} P, A, R, \\ P, A, t \end{matrix} \right\}$  to find  $\left\{ \begin{matrix} t^2 \\ R^2 \end{matrix} \right.$

Theorem 3.  $\left\{ \frac{A}{P} = R^t \right.$

Rates.

190 *The Use of Decimals in Interest.*

<i>Rates.</i>	<i>Logarithms.</i>	<i>Rates.</i>	<i>Logarithms.</i>
1,10 =	0,041392	1,055 =	0,023252
1,08 =	0,033423	1,045 =	0,019116
1,06 =	0,025305	1,04 =	0,017033
1,05 =	0,021189	1,03 =	0,012837

*Question 1.* What will 256 l. 10 s. amount to in 7 Years, at 6 l. per Cent. &c. Compound Interest?

Here is given  $\left. \begin{array}{l} P = 256,5 \\ R = 1,06 \\ t = 7 \end{array} \right\}$  To find *A*, per Theorem 1.

Multiply the *Logarithm* of the Rate 1,06 = 0,025305  
By the *Index* of its Power (viz. *t* =) 7

The Product the *Logarit.* of  $R^t = 1,50363 = 0,177135$   
Multiply that by *P* — = 256,5 = 2,409087

The Product is the Amount  $A = 385,6811 = 2,586222$   
That is, 385 l. 13 s. 7  $\frac{1}{2}$  d. the Answer required.

*Question 2.* What *Principal*, or *Sum* of Money, will raise a Stock of 20,6 in 5 Years, at 5 l. per Cent. per Annum Compound Interest?

Here is given  $\left. \begin{array}{l} A = 20,5 \\ t = 5 \\ R = 1,05 \end{array} \right\}$  To find *P*, per Theorem 2:

Multiply the *Logarithm* of the Rate 1,05 = 0,021189  
By the *Index* of its Power *t* = — 5

The Product is the *Logar.* of  $R^t = 1,27628 = 0,105945$   
By which divide the *Amount*  $A = 20,6 = 1,313867$   
2.

The *Quotient* is the *Principal*  $P = 16,1407 = 1,207922$   
That is 16 l. 7 s. the Sum required.

*Question 3.* In what *Time* will 37 l. 15 s. amount to 76,05 l. (or 76 l. 13 s.) at 4 l. 10 s. per Cent.?

Here is given  $\left\{ \begin{array}{l} A = 76,65 \\ P = 37,75 \\ R = 1,045 \end{array} \right. \left. \begin{array}{l} \\ \\ \end{array} \right\}$  To find *t*, per Theorem 3.

Divide

Divide the Amount —  $A = 76,65 = 1,884512$   
 By the Principal (or Sum)  $P = 37,75 = 1,576916$

The Quotient is —  $\frac{A}{P} = R^t = 2,03046 = 0,307595$

Then 2,03046 divided by ( $R =$ ) 1,045; and that Quotient again by 1,045; and thus continually dividing the Quotients by 1,045, 'till nothing remains, the *Number* of such *Divisions* will be equal to ( $t =$ ) the *Time* sought. But this is sooner, and easier done by much, by *Logarithms*.

Thus, *Divide the Logarithm* of 2,03046 ( $= R^t$ ) by the *Logarithm* of 1,045 ( $= R$ ) and the Quotient is the *Time*.

0,019116) 0,307596 (16,091 =  $t$  the *Time* sought.

19116  
 116436  
 114696  
 ———  
 1740  
 1720  
 ———  
 20  
 19  
 ———  
 1

{ *Viz.* 16 Years, 1 Month,  
 and 5 Days, the *Ans.*

*Question 4.* At what *Rate* of *Compound Interest*, will 51 *l.* 15 *s.* amount to 70 *l.* 18 *s.* in 5 *Years*?

Here is given  $\left\{ \begin{array}{l} P = 51,75 \\ A = 70,9 \\ t = 5 \end{array} \right\}$  To find  $R$ , per *Theorem 3.*

Divide the Amount —  $A = 70,9 = 1,850646$   
 By the Principal or Sum —  $P = 51,75 = 1,713910$

The Quotient will be  $R^t = R^5 = 1,370048 = 0,136736$

The Surfolid Root of which is  $R = 1,065 = 0,027347$   
*l. l. l. l. l. s.*

Then say, As 1 : 1,065 :: 100 : 106,5 = 106 — 10 =  $R$   
 the *Rate per Cent. per Annum* sought.

*Note*;  $R^t$  being equal to 1,370048, of Consequence  $R =$   
 $\sqrt[5]{1,370048}$ , which may be extracted by an *Algebraick* *con-*  
*verging Series*; the Manner of doing it, see in *Chap. 11.* of  
 the *Use of Decimals in Algebra.*

Theo-

Question 2. What Annuity 3 l. 10 s. per Cent. Compound Interest, will raise a Stock of 344 l. 5 s. being forborn 8 Years?

Here is given  $\left\{ \begin{array}{l} A = 344,25 \\ R = 1,035 \\ t = 8 \end{array} \right\}$  To find  $U$ , per Theor. 2.

Multiply the Amount. —  $A = 344,25 = 2,536874$   
 By the Rate —  $R = 1,035 = 0,014940$

From that Product —  $RA = 356,29875 = 2,551814$   
 Subtract the Amount —  $A = 344,25$

The Remainder is  $RA - A = 12,04875$ , the Divid.

Then involve —  $R = 1,035 = 0,014940$   
 To the 8th Power — viz.  $R^8 = 8$

That Power will be  $R^8 = 1,316803 = 0,119520$   
 The same less Unity is  $R^8 - 1 = 0,316803$ , the Divisor.

Therefore divide  $RA - A = 12,04875 = 1,080908$   
 By —  $R^8 - 1 = 0,316803 = 9,500785$

The Quotient is —  $U = 38,0297 = 1,580123$

The Annuity therefore which was sought, is found to be 38,0297 l. = 38 l. 0 s. 7 d. per Annum, Answer.

Question 3. In what Time will 38 l. 0 s. 7 d. raise a Stock of 344 l. 5 s. at 3 l. 10 s. per Cent. per Annum, Compound Interest?

Here is given  $\left\{ \begin{array}{l} U = 38,0297 \\ A = 344,25 \\ R = 1,035 \end{array} \right\}$  To find  $t$ , per Theor. 3.

194 *The Use of Decimals in Interest.*

First multiply the Amount  $A = 344,25 = 2,536874$   
 By the given Rate  $R = 1,035 = \underline{0,014940}$   
 To that Product  $RA = 356,29875 = 2,551814$   
 Add the Annuity  $U = \underline{38,0297}$   
 From the Sum  $RA + U = 394,32845$   
 Take the Amount  $A = \underline{344,25}$   
 The Remainder is the }  $RA + U - A = 50,07845 = 1,699651$   
 Divi. which }  $U = 38,0297 = 1,580123$   
 divide by  
 The Quotient will be  $Rt = \underline{1,316803 = 0,119528}$

Then Divide  $1,316803$  continually by the Rate  $1,035$  until nothing remains, and the Number of those Divisions will be  $8 = t =$  Time required.

But much better by Logarithms thus; Divide the Logarithm of the Power by the Logarithm of the Rate, the Quotient is  $= t$  the Time sought.

Thus  $0,014941 \div 0,119528$  ( $8 = t$  the Time, *viz.*)  
 $0,119528$  8 Years; Answer. J  
 .....

*Question 4.* At what Rate per Cent. Compound Interest, will 30l. Yearly Rent, being forborne or unpaid 9 Years, amount to 344l. 14 s.  $6\frac{1}{4}d.$

Here is given  $\left. \begin{array}{l} U = 30 \\ A = 344,7267 \\ t = 9 \end{array} \right\}$  To find  $R$ , per The. 4.

First divide the Amount.  $A = 344,7267 = 2,537475$   
 By the Annuity  $U = 30 = \underline{1,477121}$   
 The Quotient is  $U = \underline{11,4909 = 1,060354}$   
 Again the Amount }  $A - U = 314,7267 = 2,497933$   
 less the Annuity is }  
 Which divide by  $U = 30 = \underline{1,477121}$   
 The Quotient is  $U = \underline{10,49014 = 1,020812}$

Now  $Rt = R^9$ . Therefore the Theorem affords this Equation, *viz.*  $11,4909R - R^9 = 10,49014$

This

This Equation is easily resolv'd by a *Converging Series* (which see in the *Use of Decimals in Algebra.*)

*Note.* This Question may be very easily and expeditiously answer'd, by the Rule of *False Position*; thus

Make *two Suppositions*, of the *Rate*, which may include between them the *Rate you seek*.

Then find what the *Amounts* of the given *Annuity* would be at the *two supposed Rates* of *Interest*, per *Theorem 1.*

Lastly; Observe the *Errors* of those *Amount* from the *Amount here given*, then by those *Suppositions* and their *Errors*, find the *true Rate*, (*viz.* 1,06) as is there taught.

**Theorems resolving all Questions concerning the Present Worth of Annuities, Pensions, or Leases in Reversion, at Compound Interest.**

Given  $U, R, t$ ; To find  $P$ ?

$$\text{Theorem 1. } \left\{ \frac{U - \frac{U}{R^t}}{R - 1} = P. \right.$$

Given  $P, R, t$ ; To find  $U$ ?

$$\text{Theorem 2. } \left\{ \frac{PR^t \times R - PR^t}{R^t - 1} = U. \right.$$

Given  $U, R, P$ ; To find  $t$ ?

$$\text{Theorem 3. } \left\{ \frac{U}{P + U - PR} = R^t. \right.$$

Given  $U, P, t$ ; To find  $R$ ?

$$\text{Theorem 4. } \left\{ \frac{U}{P} = \frac{U}{P} R^t + R^t - R^{t+1}. \right.$$

*Question 1.* What is 30 l. Yearly Rent, Worth in ready Money, for its Continuance 7 Years, allowing 6 l. per Cent. Compound Interest to the Purchaser?

Here is given  $\left\{ \begin{array}{l} U = 30 \\ R = 1,06 \\ t = 7 \end{array} \right\}$  To find  $P$ , per *Theorem 1.*

196 *The Use of Decimals in Interest.*

First, involve —  $R = 1,06 = 0,025305$   
 To the 7th Power, (viz.  $R^7$ ) —  $7$   
 That will be —  $R^7 = 1,50061 = 0,177135$   
 Then divide —  $U = 30 = 1,477121$   
 By  $R^7$ , there will remain  $\frac{U}{R^7} = 19,9520 = 1,299986$   
 Then from the Annuity  $U = 30$   
 Subtract —  $\frac{U}{R^7} = 19,952$   
 Remains the Dividend  $U - \frac{U}{R^7} = 10,048 = 1,002079$   
 Which divide by the Rate less }  $= 0,06 = 8,778151$   
 Unity  $= R - 1$  — }  
 The Quotient is the present }  $= 167,4716 = 2,223928$   
 Worth —  $P$  — }  
 The Present Worth, in ready Money is 167 l. 9 s. 5 d. the Answer.

*N. B.* Suppose this were an *Annuity in Reversion*, or not to be entered on till after 7 Years are past, and thence to continue 7 Years; and you would know the *present Worth*; find by the second Theorem of *Compound Interest*, what *ready Money* will amount to 167 l. 9 s. 5 d. in 7 Years, at the *same Rate* of Interest; and that will be its *present Worth*; and so for any other *Annuity in Reversion*.

*Question 2.* What *Annuity*, to continue 7 Years, may be purchased for 120 l. 5 s. at 6 per Cent. *Compound Interest*?

Here is given  $\left. \begin{array}{l} P = 120,25 \\ R = 1,06 \\ t = 7 \end{array} \right\}$  To find  $U$ , per *Theor.* 2,  
 Involve the Rate —  $R = 1,06 = 0,025305$   
 To the Index of its Power (viz.  $t$ ) —  $7$   
 The Power of  $R$  will be  $R^7 = 1,50361 = 0,177135$   
 Which mult. by the present Worth  $P = 120,25 = 2,80084$   
 The Product is —  $PR^7 = 180,8087 = 2,257219$   
 Multiply that by the Rate —  $R = 1,06 = 0,025305$   
 That Product is  $PR^7 \times R = 191,65722 = 2,282524$   
 From which subtract  $PR^7 = 180,8087$   
 There Remains the Dividend  $10,84852 = PR^7 \times R$   
 —  $PR^7$  Divide

*The Use of Decimals in Interest.*     197

Divide therefore  $PR \times R - PR^t = 10,84852 = 1,035359$   
 By the Power of  $R$  less 1  $= R^t - 1 = 0,50361 = 9,702113$

The Quotient is the Annuity  $U = 21,54057 = 1,333256$

The Annuity sought therefore is 21,54057*l.* = 21*l.*  
 10*s.* 9  $\frac{1}{2}$  *d.*

*Question 3.* For what Time will 167*l.* 9*s.* 5*d.* purchase an Annuity of 30*l.* per Annum, at 6 per Cent. Compound Interest?

Here is given  $\left. \begin{array}{l} P = 167,4716 \\ U = 30 \\ R = 1,06 \end{array} \right\}$  To find  $t$ , per Theor. 3.

To the present Worth  $P = 167,4716$   
 Add the Annuity  $U = 30$

The Sum is  $P + U = 197,4716$

Then mult. the present Worth  $P = 167,4716 = 2,223928$

By the Rate  $R = 1,06 = 0,025305$

The Product is  $PR = 177,5199 = 2,249233$

Which subst. from Sum of  $P + U = 197,4716$

The Remainder is  $P + U - PR = 19,9517$  the Divisor.

Then Divide the Annuity  $U = 30 = 1,477121$

By the Divisor  $P + U - PR = 19,9517 = 1,299986$

The Quotient is  $R^t = 1,50361 = 0,177135$

Lastly, Divide the Logarithm of  $R^t$ , by the Logarithm of the Rate; the Quotient will be the Time =  $t$  sought.

Thus,  $0,025305 \quad 0,177135$  ( $7 = t$  the Time sought, }  
 $\quad \quad \quad 0,177135$      *viz.* 7 Years. Answer, }  
 .....

*Question 4.* Suppose I purchase an Annuity of 21*l.* 10*s.* 9*d.* to continue 7 Years, for 120*l.* 5*s.* ready Money; at what Rate per Cent. Compound Interest, was the Purchase made?

Here is given  $\left. \begin{array}{l} P = 120,25 \\ U = 21,54057 \\ t = 7 \end{array} \right\}$  To find  $R$ , per The. 4.

First,

298 *The Use of Decimals in Interest.*

First, divide the Annuity  $U = 21,54057 = 1,333256$   
 By the present Worth  $- P = 120,25 = 2,080084$   
 The Quotient is  $-\frac{U}{P} = 0,17915 = 9,253172$

Then multiply it into the given Power of the Rate, to which add the Power, &c. as per Theorem; and you have this Equation, viz.  $0,17915R^7 + R - R^8 = 0,17915$ ; whence a Person ready at Algebraick Extractions, may soon discover  $R = 1,06$ . Then say, as  $1 l. : 0,06 l. :: 100 l. : 6 l.$  the Rate per Cent. requir'd.

Note; This (and all Questions of this Nature) may be answered by the Rule of Position, in the same manner as was directed in the fourth Question of Annuities in Arrears.

**Theorems resolving all Questions relating to the Purchasing of Free-hold or Real Estates, at Compound Interest.**

Given  $P R$ ; To find  $U$ ?

Theorem 1.  $P R - P = U$ .

Given  $U R$ ; To find  $P$ ?

Theorem 2.  $\frac{U}{R - r} = P$ .

Given  $P, U$ ; To find  $R$ ?

Theorem 3.  $\frac{P + U}{P} = R$ .

Question 1. Suppose a Free-hold Estate of 25 *l.* per Annum were to be sold; What is the Worth, allowing 5 *l.* 10 *s.* per Cent. &c. Compound Interest to the Buyer?

Here is given  $\left\{ \begin{array}{l} U = 25 \\ R = 1,055 \end{array} \right\}$  To find  $P$ , per Theor. 2.

Divide the Annual Rent  $- U = 25 = 1,397940$   
 By the Rate less Unity  $- R - 1 = 0,055 = 8,740362$

The Quotient is the Worth  $P = 484,5 = 2,657578$

The Value of that Estate therefore is 454 *l.* 10 *s.* 10  $\frac{1}{4}$  *d.*

*R. E. I.*

Question

*The Use of Decimals in Interest.*      159

*Question 2.* Suppose a Person would buy out 416 l. 13 s. 4 d. on a *Free-hold Estate*, and so as to be allowed 6 l. *per Cent.* for his Money, *Compound Interest*; What must be the *Annual Rent* of such an Estate?

Here is given  $\left\{ \begin{array}{l} P = 416,6 \\ R = 1,06 \end{array} \right\}$  To find *U*, *per Theor. 1.*

Multiply the present Worth —  $P = 416,6 = 2,619789$   
By the Rate —  $R = 1,06 = 0,025305$

The Product is —  $PR = 441,6 = 2,645094$

From which subtract the Worth  $P = 416,6$

There remains the Annual Rent }  $U = 25$  *per Annum.*  
The Answer

*Question 3.* Suppose one give 416 l. 13 s. 4 d. for a *Free-hold Estate* of 25 l. *per Annum*; What *Rate per Cent. Compound Interest*, has the *Purchaser* for his Money?

Here is given  $\left\{ \begin{array}{l} P = 416,6 \\ U = 25 \end{array} \right\}$  To find *R*, *per Theor. 3.*

To the present Worth —  $P = 416,6$

Add the Annual Rent —  $U = 25,0$

Divide their Sum —  $P + U = 441,6 = 2,645094$

By the present Worth —  $P = 416,6 = 2,619789$

The Quotient is the Rate sought  $R = 1,06 = 0,025305$

Then say, As 1 l. : ,06 l. : : 100 l. : 6 l. *per Cent.* the Answer.

### Rebate or Discount.

What this is I have already defin'd in the Beginning of this Chapter; The *Interest*, and *Discount*, of the same Parcel of Money, is very different, tho' vulgarly understood. (and accordingly is reckoned) the same thing.

In order therefore to have a right Notion of *Discount*, and how it differs from *Interest*; we must consider, that *Interest* is the Increase of any *Principal*, or Sum of Money, according to any Rate, or Proportion, agree'd on; and in computing it, we have Regard only to the bare *Principal*; But what is properly call'd *Discount*, is the Difference between a Sum of Money due any Time hence, and such another Sum as, being put to *Interest*, would, with its Increase by *Interest*, become equal to the said Sum hereafter due.

Thus,

200 *The Use of Decimals in Interest.*

Thus, for *Example*, If I have 105 l. due to me 12 Months hence; the *Discount* for *prompt Payment* thereof at 5 l. *per Cent. Simple Interest* must be 5 l. and the *present Money*, or *Worth* of that 105 l. is 100 l.; Because if I put 100 l. out at the aforesaid *Rate*, it would in *that Time* be equal or amount to 105 l. Wherefore the *Interest* of 105 l. discounted (as is the common way) I should receive but 99 l. 15 s.; the *Interest* of the 105 l. being 5 s. more than the true *Discount*; and consequently the reckoning *Interest* for *Discount* is very disadvantageous to those who make such *Discounts*.

The Proportion for *Rebate* or *Discount* then is,

As 100 l. and the *Rate* : is to the *Rate* :: so is any other Sum : to its true *Discount* for the same *Time*.

The *Theorem* for finding at once both the *Discount* and *present Worth* of any Sum of *Money*, due any time hereafter, is the second *Theorem* of *Simple* and *Compound Interest*, as I there observ'd.

By the second *Theorem* of *Simple Interest*, it was found that the *present Worth* of 405 l. 6 s. 0 d. due 5 Years and 8 Months hence at 5 *per Cent*.

	<i>l.</i>	<i>s.</i>	<i>d.</i>
Must be	—	—	—
Which subtracted from the <i>Debt</i> ,	—	—	—
leaves the true <i>Discount</i>	—	—	—
But the <i>Interest</i> of that Sum is	—	—	—
for that <i>Time</i>	—	—	—
Which exceeds the true <i>Discount</i> by	—	—	—
	24	18	7

Above a fourth Part loss to the *Discount*er of *Interest* for such a Sum.

*Note.* This *Theorem* of Mr. *Ward's*, is far more easy, concise, and elegant, than any other extant, for finding the *present Worth*, or *Discount* for *prompt Payment* of any *Debt*.

*A Table of Days for any given Time.*

Days	January	February	March	April	May	June	July	August	September	October	November	December
1	1	32	60	91	121	152	182	213	244	274	305	335
2	2	33	61	92	122	153	183	214	245	275	306	336
3	3	34	62	93	123	154	184	215	246	276	307	337
4	4	35	63	94	124	155	185	216	247	277	308	338
5	5	36	64	95	125	156	186	217	248	278	309	339
6	6	37	65	96	126	157	187	218	249	279	310	340
7	7	38	66	97	127	158	188	219	250	280	311	341
8	8	39	67	98	128	159	189	220	251	281	312	342
9	9	40	68	99	129	160	190	221	252	282	313	343
10	10	41	69	100	130	161	191	222	253	283	314	344
11	11	42	70	101	131	162	192	223	254	284	315	345
12	12	43	71	102	132	163	193	224	255	285	316	346
13	13	44	72	103	133	164	194	225	256	286	317	347
14	14	45	73	104	134	165	195	226	257	287	318	348
15	15	46	74	105	135	166	196	227	258	288	319	349
16	16	47	75	106	136	167	197	228	259	289	320	350
17	17	48	76	107	137	168	198	229	260	290	321	351
18	18	49	77	108	138	169	199	230	261	291	322	352
19	19	50	78	109	139	170	200	231	262	292	323	353
20	20	51	79	110	140	171	201	232	263	293	324	354
21	21	52	80	111	141	172	202	233	264	294	325	355
22	22	53	81	112	142	173	203	234	265	295	326	356
23	23	54	82	113	143	174	204	235	266	296	327	357
24	24	55	83	114	144	175	205	236	267	297	328	358
25	25	56	84	115	145	176	206	237	268	298	329	359
26	26	57	85	116	146	177	207	238	269	299	330	360
27	27	58	86	117	147	178	208	239	270	300	331	361
28	28	59	87	118	148	179	209	240	271	301	332	362
29	29		88	119	149	180	210	241	272	302	333	363
30	30		89	120	150	181	211	242	273	303	334	364
31	31		90		151		212	243		304		365

*The Use of the Table.*

First; To know the *Number* of Days from the *Beginning* of the Year, to any given Day of any Month.

D d

This

## 202 *The Use of the preceeding Table.*

This is obtain'd by Inspection only ; Thus from *January* the 1st, to *September* the 7th, is 250 Days ; To *November* the 27th are 331, &c.

*Secondly*, To know what is the *Number of Days* from any given *Day of any Month*, to the *End of the Year*.

Suppose *September* the seventh, then from — 365  
*Subtract* the Number answering to *Sept. 7* — 250

There remains the *Number of Days* sought, viz. 115 Days.

*Thirdly*, To find the *Number of Days* between the given *Day of any one Month*, and any given *Day of any other Month*, in the *same Year*.

For Instance, To know how many *Days* there are between *April* the 17th, and *October* 23.

Thus, From the Number answering to *October* 23 — 296  
*Subtract* that answering to *April* 17 — 107

The *Remainder* is the *Number of Days* sought — 189

*Fourthly*, To find the *Number of Days*, from any given *Day of any Month* in one *Year*, to any given *Day of any Month* in the *next Year*.

How many *Days* is it from *September* the 7th, 1733, to *April* the 19th, 1734 ?

From the *Days of a Whole Year* — 365  
*Subtract* the Number to *September* 7 — 250

Remains the Number to the *End of the Year* — 115  
 To which *add* the Number to *April* 19 — 109

The *Sum* is the *Number of Days* required — 224

And thus is the *Number of Days* readily found for any *Interval of Time* given, in the *same Year* completely ; or which is part of one, or part of another *Year*.

How very *necessary* and *useful* a *Table* this is in all *Parts of Arithmetical Science* relating to *Time* is sufficiently evident to the *Skilful* therein ; but because it is more *particularly* so in the whole *Affair of Interest*, I have therefore prefixed it to the other *Tables*.

Having then the *Number of Days*, 'tis easy to find what *Decimal Part of the Year*, they make ; and having found that, you have the *T, t*, in the foregoing *Theorems* representing any *Part of a Year*. An

*The Nature, Construction, and Use, &c.* 203

An Example in *Simple and Compound Interest*, will make the whole Matter easy and conspicuous.

*Example 1.* What will 65*l.* amount to, being lent from *March* the 7th to *November* the 3d, at 5*l.* per Cent. per *Annum Simple Interest*?

From *March* the 7th to *November* the 3d are 241 Days; those make 8 *Months*, 2 *Weeks*, and 3 *Days*, = 660273 *Decimals* of a Year. Then by *Theorem 1.*

$$\begin{array}{r} \text{Multiply the Time} \quad \text{---} \quad \text{---} \quad T = 0,660273 \\ \text{By the Ratio of the Rate} \quad \text{---} \quad \text{---} \quad R = \quad \quad 0,05 \end{array}$$

$$\begin{array}{r} \text{And that Product} \quad \text{---} \quad TR = 0,03301365 \\ \text{Multiply by the Principal} \quad \text{---} \quad P = \quad \quad \quad 65 \end{array}$$

$$\begin{array}{r} \text{The Product is} \quad \text{---} \quad TRP = 2,14588725 \\ \text{To which add the Principal} \quad P = 65 \end{array}$$

The Sum is the *Amount* sought = 67,1458 &c. *l.*

*Example 2.* What is the *Amount* thereof at *Compound Interest*, the *Rate* and *Time* being the same?

$$\begin{array}{r} \text{The Logarithm of the Rate} \quad R = 1,05 = 0,0211893 \\ \text{Multiply by the Time} \quad \text{---} \quad t = \quad \quad \quad ,6603 \end{array}$$

$$\begin{array}{r} \text{The Product is the Logar. of } R^t = R^{0,6603} = 0,0139912 \\ \text{To which add the Log. of the Prin. } P = 63 = 1,8129133 \end{array}$$

The Sum is the Log. of *Amount*  $A = 67,1281 = 1,8269045$

And thus the *Theorems* serve to answer *Questions*, when the *Time* is only *part* of a Year, as well as when *complete* Years,

*Proem to the Tables of Simple Interest, concerning their Nature, Construction, and Use.*

The great Design of *Tables of Interest* (both *Simple* and *Compound*) is *Ease* and *Expedition* in practical *Calculations*. For, besides that the *Rules* expressed in *Words* for answering *Questions of Interest* are *tedious* and *intricate*, and the *Reason* no ways to be understood; the *Operations* themselves are, for the most part, very *laborious*; and consequently *Tables* which expedite and facilitate the *Practice* are indispensibly necessary.

## 204 *The Nature, Construction, and Use*

This being undeniably evident, the Question occurs, Whether *these Tables* are to be made in *Decimal* or *mixed Numbers* (i. e. such as express the *Money* in its common Denominations of *Pounds, Shillings, and Pence*)? The Answer to this can admit of no *Demurr* amongst those who understand the Doctrine of *Decimal Numbers*; they all know the *Excellency* and superiour Use of the *first Sort*, viz. *Decimal Tables*. But *Interest Tables* expressed in *common Money* are indulged to those who understand not *Decimals*, as *Crutches* to the *Lame*, and *Spectacles* to the *Weak-sighted*.

The *Numbers* in the *first* of these *Tables* of *Simple Interest* for *Days*, and in the *Second* for *Years*, being in *Arithmetical Proportion*, makes them capable of that *Perfection*, which no other *Tables* can pretend to.

*These Tables* are so contrived, That the *Interest* of any *Principal Sum* is easily found for any *Number* of *Days* or *Years* at any *Rate* from *one Pound* to *Ten*, with the *Halves* and *Quarters*. Having followed herein the *Rev. Mr. Brown* in his *Arithmetica Infinita*.

The *Construction* of these *Tables* is easy from the *Theorems* themselves, (and indeed the *Reason* of their *Construction* can be no otherways so easily conceiv'd.) Thus by *Theorem* the *first* of *Simple Interest*, viz.  $tRP + P = A$  is the *first* and *second Table* constructed. For since the *Amount* less the *Principal*, is equal to the *Interest*, therefore the *Theorem* will be  $tRP = \text{Interest}$ . Now if  $P = 1 \text{ l. } t = ,002739 \text{ Sc.}$  (the *Decimal* of a *Year* for *one Day*), and  $R =$  any *Ratio* of *Interest*, suppose *5 per Cent.*; then the *Simple Interest* of *one Pound* for *one Day*, at *5 per Cent.* is  $,002739 \text{ Sc.} \times ,05 \times 1 = 00013698 \text{ Sc.}$  which being multiplied by the *nine Digits* severally constitute that part of the *Table* of *Interest* at *5 per Cent.* and thus the whole *first Table* is made. The *second Table* for *Years* is only the various *Ratios* of *Interest* multiplied by the said *Nine Digits*; for since  $t = 1 \text{ Year}$ , and  $P = 1 \text{ l.}$  it will be  $tRP = R$  the *Interest* for the *first Year*, &c.

The *third Table* shews the *Rebate* or *Discount* to be made for *one Pound*, at the several *Rates per Cent.* for *Days*. The *Manner, Truth, and Reason* of its *Construction* is derived from *Theorem 2.* of *Simple Interest*, viz.  $\frac{A}{tR - 1} = P$ . For since the *Principal* or *present Worth* subducted from the *Amount* gives the *Rebate* or *Discount* of that *Amount*; therefore

for the *Discount* of any *Amount* for any *Time* at any *Rate* (without *Regard* of the *present Value* or *principal Money*)

may be found by this *Theorem*  $\frac{AtR}{tR + 1} = D = \text{Discount}$ .

Hence if we put  $A = 1$  l.  $t = ,002739$  &c. and  $R =$  any *Ratio of Interest*, suppose *5 per Cent.* then by this *last Theorem* we have the *Discount* of one *Pound* for one *Day* at the *Rate* of *5 per Cent. per Annum*; For  $AtR = 1 \times ,002739$  &c.  $\times ,05 = ,00013698$  &c. And  $tR + 1 = 1,00013698$  &c. then by *Division*;  $,00013698$  &c.  $\div 1,00013698$  &c. (=  $,00013697$  &c. the *Discount*. If  $t = 1$  *Year*; then the *Annual Discount* of one *Pound* at *5 per Cent.* will be found, by the above *Theorem*, thus;  $AtR = ,05$  and  $tR + 1 = 1,05$ . Therefore by *Division*,  $,05 \div 1,05 = ,04761904$  &c. the *Discount*. And thus is the *Discount* of any *Sum* at any *Rate* for any *Time* above one *Year* found at once by the above *Theorem*; and for any *Time* under a *Year* by the *Table of Discount* for *Days*, of which I have now taught the *Construction* in a *new and more rational Method* than any I have yet seen.

### The Use of *Table I*, and *II*.

In order to understand how to make those two *Tables* universally useful, the *Reader* is to observe, that if a *Number* consists of only one *Digit* with *Cyphers* affixed, as 10, 50, 700, 9000, 800000, &c. 'tis called a *pure Number*; but those *Numbers* which consist of more than one, or wholly of *Digits*, As 370, 568, 7569, &c. may be called *Mixed Numbers*. Now every *mixed Number* may be resolved into those *pure Numbers*, of which they are composed; thus the *mixed Number* 567, may be resolved into the *Pure Numbers* 500, 60, and 7; so also 15890 is resolved into 10000, 5000, 800, and 90.

Now then as to the *Use* of the *Tables*, observe these *Rules*;

I. If the *Number* of *Days*, *Years*, &c. proposed, be a *mixed Number*, let it be resolved into *pure Numbers*.

II. With the *pure Numbers* severally enter the *Tables*, and take those *Decimal Numbers* which stand against the first *Figure* of each *pure Number*, in the *Column* marked *Numbers*.

III. Remove the *Decimal Point* in each such *Decimal Number*.

## 206 *The Nature, Construction, and Use*

Number, so many Places to the *Right-hand*, as there are *Cyphers* in the respective *pure Numbers*.

IV. Lastly, Add together all the *Decimal Numbers*, and find the *Value* thereof by the *Tables* for that purpose.

These things *premised*, the *Use* of the *Tables* will be obvious from the *Examples* of the following *Problems*.

### *Problem 1.*

To find the *Interest* of any *Sum* of *Money* for a *Day*, or a *Year*, at any *Rate per Cent. per Annum*.

### *Example 1.*

What is the *Interest* of 2746 *l.* at 5 *l.* 15 *s.* *per Cent.* for a *Day*?

		<i>Decimals.</i>
In <i>Table 1.</i> under	2000 —	,31506
the <i>Rate</i> 5 $\frac{1}{2}$ . You	700 —	,11027
find against the <i>pure</i>	40 —	,00630
<i>Numbers</i>	6 —	,00094
		,43257
The <i>Answer</i> is	— —	= 8 <i>s.</i> 7 $\frac{1}{2}$ <i>d.</i>

### *Example 2.*

What is the *Interest* of the same *Sum*, at the same *Rate* for a *Year*?

		<i>Decimals.</i>
In <i>Table 2.</i>	2000 —	150,00000
You find against	700 —	40,25000
	40 —	2,30000
	6 —	0,34500
		1,92,895
The <i>Answer</i> in <i>Decimals</i>	= 1,92,895	
	Which is in <i>Money</i> = 192 <i>l.</i> 17 <i>s.</i> 10 $\frac{1}{2}$ <i>d.</i>	

### *Problem 2.*

To find the *Interest* of any *Sum* of *Money* for any *Num.* ber of *Days*.

### *Example.*

What is the *Interest* of 265 *l.* for 149 *Days*, at the *Rate* of 3 *l.* 15 *s.* *per Cent.* &c.

Multi-

of Decimal Tables of Simple Interest. 207

Multiply the *Principal Sum* — 265 l.  
 By the given Number of *Days* — 149

The Product is the *mixed Number* 39485, with which resolved, enter the Table as before :

Thus in Table 1.  $\left\{ \begin{array}{l} 30000 \text{ — } 3,08200 \\ 9000 \text{ — } 0,92466 \\ 400 \text{ — } 0,04109 \\ 80 \text{ — } 0,00822 \\ 5 \text{ — } 0,00051 \end{array} \right\}$  Under  $3\frac{1}{4}$  per Cent.

The Answer in *Decimals* — l. 4,05648

In *Money* 4 l. 1 s. 1  $\frac{1}{2}$  d.

The Method is the same for any greater Number of Days.

*Problem. 3.*

To find the *Interest* of any *Sum* forborne any Number of *Years* at any of the given *Rates per Cent.*

*Example.*

What is the *Interest* of 175 l. 15 s. forborne 13 *Years* at the *Rate* of 6 per Cent. &c.?

Multiply the *Principal Sum* — 175,75  
 By the Number of *Years* given — 13

The Product is the *mixed Number* — 2284,75

Which resolved, as before, will stand thus,

In Table 2.  $\left\{ \begin{array}{l} 2000, \text{ — } 120,000 \\ 200, \text{ — } 12,000 \\ 80, \text{ — } 4,800 \\ 4, \text{ — } 0,240 \\ ,7 \text{ — } 0,042 \\ ,05 \text{ — } 0,003 \end{array} \right\}$  Under 6 per Cent.

The Answer in *Decimals* l. 1,137,085

The same in *Money* 137 l. 1 s. 8 d  $\frac{1}{2}$ .

N. B. The

In the Table under 5 per }  
 Cent. and against 365 Days is } ,047619 &c.  
 Which mul. by the Principal Sum 100 l. s. d.  
 The Product is the Answer l. 4,7619 &c. = 4-15-2 $\frac{1}{4}$   
 Now the Interest of 100 l. for one Year, at 5 }  
 per Cent. is — — — } 5-0-0  
 The Differ. therefore of Discount and Interest; is 0-4-9 $\frac{3}{4}$

Whence 'tis evident, he who allows *Interest* for *Discount* wrongs himself considerably, which yet is very common among *Traders*; for so much Money ought to be paid, as, at *Interest*, would amount to the *Sum* due, in the *Time* proposed.

*Example 2.*

What is the *Discount* of 9342 l. at 4 $\frac{1}{2}$  per Cent. for a Year?

The *Discount* of 1 l. for 365 Days, at }  
 4 $\frac{1}{2}$  per Cent. in the Table, is — } ,043062, &c.  
 Which multiplied by the Principal Sum 9342  
 The Product is the Answer — l. 402,2852 &c.

In *Money* 402 l. 5 s. 8 $\frac{1}{2}$ . And thus proceed for other annual *Discounts*.

I must acknowledge this Table of *Discount* gives not the precise Truth, and yet differs but little from it; being sufficiently *exact* for any Use. None but a Table of the *Discount* for every Day, can be perfect; because every Day's *Discount* differs, being still less as the Number of Days increase.

This Table is perfectly true for all the Days express'd therein, and, as I said, may be used without much Error for any other.

		l. s. d.
<i>Example</i> in Prob. 4.	}	The true <i>Discount</i> is — 2-1-11
		The <i>Discount</i> by this Table 2-2-2 $\frac{1}{4}$
		The <i>Int.</i> for the Time and Rate 2-3-0

## TABLES of Simple Interest.

Table I. *The Interest of one Pound for Days.*

*The*

## The Nature, Construction, and Use of the Decimal Tables of Compound Interest.

What *Compound Interest* is, I have already shewn in the *Theoretical* Part of this Doctrine; and from the said *Theory* it also appears that Tables of *Compound Interest* are absolutely necessary for those who understand not *Logarithms* or *Algebra*; and therefore (though I have taught the Use of *Logarithms* after the *best Manner* in this Book) yet I have supplied the Reader with a *Set of Six Tables* for the Purposes of *Compound Interest*; I have framed them from the most compleat and approved *Calculations* of Mr. *John Smart*; his Book (which is *wholly* on *Tables of Interest*) having the best *Character* for Exactness, and the *Errata's* of the Press, no more than *four*.

As I intend *nothing* shall be wanting in any Part of this *System*, to make it *compleat*; so I have contrived these Tables to answer any *Question* of *Compound Interest*, for the *Rates* contained therein: For though they are not so large as the *Largest*, yet are they *larger* and more *universal* than any others, in any *mixed Pieces* of *Arithmetick* I have yet seen; I have chosen all the most *usual* and *necessary Rates* of *Interest*; and continued each *Annual Table* to 50 *Years* which is farther than is generally needful; and shall shew how they may be used for any *indefinite* Number of *Years* required; but first of their *Construction*, which is thus in the most *demonstrative* Manner deduced from the *Theorems* aforesaid, whence not only the *Manner*, but the *Reason* of their *Construction* (a Thing very *necessary*, though I know not where else to be met with) will be exceeding apparent.

The *Construction* of the *First* Table which shews the *Amount* of *one Pound* for *Days*; as also of the *Second* Table, which shews the same for *Years*, is made from *Theorem 1.* of *Compound Interest*, which is  $PR^t = A$ . Now if we put  $P = 1$  l. then is the *Theorem* reduced to  $R^t = A$ . Consequently, if  $R = 1,05$  l. *per Cent.* (or any other *Ratio*) and  $t = 1, 2, 3, 4, \&c.$  *Years*;

*Amount*

222 *The Nature, Construction, and Use*

*Amounts.*

Then it will be  $R^1 = A = 1,05$  the *first* Year.  
Which mult. by  $R = 1,05$

The Product is  $R^2 = A = 1,1025$  the *second* Year.  
And again by  $R = 1,05$

The Product is  $R^3 = A = 1,157625$  the *third* Year.  
And again by  $R = 1,05$

The Product is  $R^4 = A = 1,21550625$  the *fourth* Year.

And thus for the other Years subsequent in the Table,

Thus also if  $R = 1,00013368$  the *Ratio* for 1 Day.  
Mult. as before  $R = 1,00013368$

The Prod. is  $R^2 = A = 1,00026738$  the *Amount* for 2 D.  
And again by  $R = 1,00013368$

The Prod. is  $R^3 = A = 1,00040110$  the *Amount* for 3 D.

Thus is found the *Amounts* for all the subsequent Days in the Table.

Here it may be proper to observe, that the *Amount* or *Interest* of any Sum, at the same *Rate*, is more at *Compound Interest* than at *Simple*, for any time *above a Year*; equal for *one Year*; but *less* for any time *less than a Year*. Though this seems *strange* in the last Assertion; yet the *Reason* is evident to any who understands and considers that *Simple Interest* is grounded on *Arithmetical*, but *Compound Interest* on *Geometrical Progression*.

The *Construction* of Table 3. is by *Theorem 2.* viz.  $\frac{A}{R^t}$   
 $= P$  the *present Worth* or *Value* of one Pound, which is here to be considered as the *Amount*; therefore if  $A = 1 \text{ l.}$   
 $R = 1,05$  and  $t = 1, 2, 3, 4, 5,$  and *Years*, as before; 'tis evident that *Unity*, or 1, being divided by the Numbers in the *second* Table (designed by  $R^t$ ) will give the Numbers in this *third* Table, or the *present Values* of 1 *l.* for the *Tabular Years*, and 5 *per Cent.* and so for any other *Rate* of *Interest*.

*Example*

Example at 5 per Cent.

Unity or 1 divided by	{	1,05	} The Quot.	is	{	0,952881	} The Present	Value of	{	1	} Years, &c.
		1,1025				0,907029				2	
		1,157625				0,863837				3	
		1,21550625				0,822702				4	
		1,276281				0,783526				5	

The Construction of Table 4. is from Theorem 1. of Annuities, &c. in Arrears, viz.  $\frac{UR^t - U}{R - 1} = A$ . Now as it is  $U = 1$ . and  $R = 1,05$  as before, then the Theorem will be brought to  $\frac{R^t - 1}{,05} = A$ , the Amount of 1 l. Annuity for the Number of Years design'd by  $t$ . That is, from  $(R^t)$  the Numbers in the second Table, subtract Unity, or 1. The Remainder divided by .05 (or  $R - 1$ ) gives the Numbers in the fourth Table.

Example at 5 per Cent.

The Num- bers in the 1 <sup>st</sup> Table less U.	{	0,05	} Which divi- ded by, 05 the	Quotients are	{	1,00000	} The Amounts	of 1 l. Annu- ity for	{	1	} Years &c.
		0,1025				2,05				2	
		0,157625				3,1525				3	
		0,21550625				4,310125				4	
		0,27628156				5,525621				5	

And thus you proceed for any other Rate of Interest.

The Construction of Table 5. is contained in Theorem 1. of the present Worth or Value of Annuities, which see; Now therein  $U = 1$ . and putting  $R = 1,05$ , and  $t = 1, 2, 3, 4, 5, &c.$  Years; that Theorem immediately becomes  $\frac{R^t - 1}{,05R^t} = P$ , the present Worth sought. But in Constructi-  
on, of Table 4. 'twas shewn that  $\frac{R^t - 1}{,05}$  constituted the Numbers of that Table. Therefore 'tis manifest, if the Num-  
bers in Table 4. be divided by  $R^t$  (that is, by 1,05<sup>1</sup>, 1,05<sup>2</sup>, 1,05<sup>3</sup>, 1,05<sup>4</sup>, &c.) the Quotients will be the Numbers of the fifth Table, at 5 per Cent. Which, in short, is only this;

Divide

## 224 The Nature, Construction, and Use

Divide the Numbers of the fourth Table, by the Numbers of the first Table, the Quotients make the fifth Table.

Table 1. Table 4. Table 5.

1,05)	1,00000	(=0,95238, &c. for the 1st Year.
1,1025)	2,05000	(=1,85941, &c. for the 2d Year.
1,157625)	3,15250	(=2,72324, &c. for the 3d Year.
1,21550625)	4,310125	(=3,54595, &c. for the 4th Year.
1,27628156)	5,525631	(=4,32947, &c. for the 5th Year, &c.

And thus for any other Rate of Interest.

The Construction of Table 6, is to be deduced from Theorem 2. of the present Worth of Annuities, &c. which see. Now since in this Case  $P$  is  $= 1$ . therefore that Theorem will be reduced to this form,  $RR^t - R^t = UR^t - U$ ; whence (at 5 per Cent.) 'twill be  $,05 R^t = UR^t - U$ ; consequently  $\frac{,05 R^t}{R^t - 1} = U$  the Annuity required; but this being

just the Reverse of  $\frac{R^t - 1}{,05 R^t}$ , which make the Numbers of Table 5. 'tis plain, these two Theorems which constitute the Numbers of Table 5. and 6. multiplied together can make but 1. that is  $\frac{,05 R^t}{R^t - 1} \times \frac{R^t - 1}{,05 R^t} = 1$ .

Hence then if the Numbers of Table 5. be made Divisors, and Unity or 1. the constant Dividend, the Quotients shall be the Numbers which constitute the sixth Table, at 5 per Cent. and after the same Manner for any other Rate of Interest.

Example at 5 per Cent.

The Numbers of Table 5 at 5 per Cent. are	{	,9523809	} divide Unity, the Quotients will be	{	1,05	} The Annuities 1 l. will purchase, for	{	1	} Years, &c.
	{	1,8594103		{	,5378049		{	2	
	{	2,7232480		{	,3637734		{	3	
	{	3,5459505		{	,2787437		{	4	
	{	4,3294767		{	,2277916		{	5	

In like manner, when necessary, may other Tables be constructed from the Theorems; Here are as many Tables as any Book (that I have seen) contains, and more than are in most. My Aim in the Construction of these Tables is more to shew the

the young Artift the Rationale or Reason thereof, than the Manner how only; ſince the latter has been often done, the former not at all that I know of; at leaſt, not in the natural Method by Deduction from the Theory it ſelf, as I have here done it.

*Quomodo factum eſt?* Is a Queſtion proper to *Mechanicks*; *Cur ita fit faciendum?* Befeems an Artift to enquire.

*The Uſe of the following Tables.*

The *Uſe* of all theſe Tables depends on this one obvious and eaſy *General Rule*,

Multiply the Tabular Number, which ſtands againſt the given Number of Days or Years, and under the given Rate of Intereſt, by the given Principal Sum; and the Product will ſatisfy the Queſtion.

Example of 246 l. at 5 per Cent. for 30 Days, or Years.

In Table I. againſt 30 Days under 5 per C. ſtands 1,0040182  
Which multiplied by the *Principal Sum* ————— 246

The Product is the *Amount* required; viz. l. 247,0684772

In Table II. Againſt 30 Years, at 5 per Cent. is 4,3219424  
Which multiplied by ————— 246

The Product is the *Amount* required; viz. l. 1063,1978 8c.

In Table III. Againſt the ſame Time and Rate, is 0,2313775  
Which multiplied by ————— 246

The Product is the *preſent Worth* required; l. 56,9189 8c.

In Table IV. For the given Time and Rate, is 66,4388475  
Which multiplied by ————— 246

The Prod. is the *A.* of ſuch an *Annuity*; l. 16343,9565 8c.

In Table V. For the given Time and Rate, is 15,372451  
Which multiplied by ————— 246

The Prod. is the *preſent W.* of that *Ann.* l. 3781,6229 8c.

## 226. *The Nature, Construction, and Use*

In *Table VI.* For the given *Time* and *Rate*, is ,0650514  
 Which multiplied by ————— 246

The Product is the purchased *Annuity*: l. 16,5026 &c.

Therefore by the *Tables* we immediately know, that 246 *L.* forborne 30 *Days*, at 5 *per Cent. per Annum Compound Interest* will amount to 247 *l.* 1 *s.* 4  $\frac{1}{2}$  *d.*

That 246 *l.* forborne 30 *Years*, at 5 *per Cent. &c.* will Amount to 1063 *l.* 3 *s.* 11  $\frac{1}{4}$  *d.*

That the *present Worth* of 246 *l.* due 30 *Years* hence, at the *Rate* of 5 *per Cent. &c.* is 56 *l.* 18 *s.* 3  $\frac{1}{4}$  *d.*

That the *Amount* of an *Annuity* of 246 *l. per Annum*, forborne or unpaid 30 *Years*, at 5 *per Cent. &c.* is 16343 *l.* 19 *s.* 1  $\frac{1}{4}$  *d.*

That the *present Worth* of an *Annuity* of 246 *l.* to continue 30 *Years*, at 5 *per Cent. per Annum*, is 3781 *l.* 12 *s.* 5  $\frac{1}{2}$  *d.*

That the *Annuity* which 246 *l.* will purchase, to continue 30 *Years*, reckoning 5 *per Cent. Interest*, is 16 *l. per Annum.*

If the *Amount* of any *Sum* be sought, for a *Number* of *Days* which are not in the *first Table*, and *Years* which are not in the *second*, observe this

*Rule*; Divide the given *Number* of *Days*, or *Years*, into two such *Numbers* as are in the *Table*, then multiply the *Amounts* pertaining to each, into each other; then shall the *Product* be the *Amount* for the *Time* required.

### *Example 1.*

What will 523 *L.* amount to, in 194 *Days*, at 5 *per Cent. per Annum*? The two *Parts* of this *Number* in the *Table*, are 190, and 4; therefore

In *Table I.* Against 190 *Days*, under 5 *per C.* is 1,0257228

And against 4 *Days*, at the same *Rate*, is 1,0005348

The *Prod.* is the *Am.* of 1 *l.* for 194 *Days*, viz. 1,0262714

Which multiply by the *Principal Sum*, viz. 523

This *Product* is the *Answer* l. 536,7309840

In *Money*, 536 *l.* 14 *s.* 9  $\frac{1}{2}$  *d.*

*Example*

Example 2.

What is the Amount of 150 l. in 91 Years, at 5 per Cent?

In Table II. Against 50 Years, under 5 per C. is 11,4674000  
 And against 41 Years, at 5 per C. is 7,3919881

The Prod. is the Am. of 1 l. for 91 Years, viz. 84,7668833  
 Which multiply by the Principal Sum, viz. 150

The Product is the Answer — 1. 12715,032495  
 In Money 12715 l. 0 s. 7  $\frac{1}{2}$  d.

Example 3.

What will 523 l. amount to in 5 Years and 194 Days, at 5 per Cent?

In Table II. against 5 Years, at 5 per Cent. is 1,2762816  
 And the Am. of 1 l. in 194 Days, as above, is 1,0262914

The Pr. is the Am. of 1 l. in 5 Years, and 194 D. 1,3098113  
 Which multiplied by the Principal Sum — 523

The Product is the Answer, viz. — 1. 685,0313413  
 In Money 685 l. 0 s. 7  $\frac{1}{2}$  d.

N. B. The other Tables of Compound Interest, as they cannot in this Manner be extended, so they seldom require it.

I shall now present the Reader with a few Questions of a more complex Nature, and which frequently happen, in order to shew the more extensive Use of the Tables.

Question 1.

Suppose I have 700 l. to be paid me within 7 Years, in this Manner; at the End of the first Year 90 l. of two Years, 100 l. of four Years 200 l. and of seven Years 400 l. Quere what the present Worth of those several Payments is in ready Money, allowing 4  $\frac{1}{2}$  per Cent. Compound Interest?

## 228 The Nature, Construction, and Use

In Table III. the *present Worth* of 1 l. at  $4\frac{1}{2}$  per Cent.

Due at the End of 1 Year, is ———— 0,9569378

Which multiply by the *Principal* ———— 90

The Product is the *present Worth* of 90 l. = 86,124402

Thus the *present Worth* of 100 l. due at }  
the End of two Years, is found } = 91,57299

Also, if 200 l. at the End of 4 Years = 167,71226

And of 400 l. at the End of 7 Years = 293,93140

The *Sum* of all these is ———— l. 639,341052

Which answers the Question, viz. 639 l. 6 s. 9  $\frac{1}{2}$  d.

### Question 2.

A owes to B 455 l. to be paid in 14 Years, viz. at the End of every 2 Years 65 l. But he would agree to pay him in 7 Years, by equal Payments each Year; which B agrees to, and at the Rate of 6 per Cent. Compound Interest. Quere what the Annual Payment must be?

1. Find the *present Worth* (by Table III.) of the 7 Payments which were at first to be made, as per *Quest.* 1. which you will find to be 293 l. 5 s. 2 d.
2. Then find (by Table VI.) what *Annuity*, to continue 7 Years at the given Rate, 293 l. 5 s. 2 d. will purchase; which you will find to be 52 l. 10 s. 8 d. and is the Answer to the *Question*.

### Question 3.

A has a Term of 7 Years in an Estate of 35 l. per Annum. B has a Term of 14 Years in the same Estate in Reversion after the 7 Years; and C has a farther Term of 20 Years in Reversion after the 21 Years. Quere the *present Values* of the several Terms, at the Rate of 5 per Cent. per Annum?

By Table V. the *present Value* of 35 l. per Annum, may be

	l.	s.	d.
found, for 41 Years, to be	—	—	605 — 6 — 0 $\frac{1}{2}$
for 21 Years, to be	—	—	448 — 14 — 9 $\frac{1}{2}$
for 7 Years, to be	—	—	202 — 10 — 5 $\frac{1}{2}$

Which

Which subtract from each other, it will appear,

	l.	s.	d.
That the present Value of A's Term is	202	10	5½
of B's Term	246	4	4
of C's Term	156	11	3

For these Values answer the Question l. 605 — 6 — 0½

Question 4.

Which is most advantageous a Term of 15 Years in an Estate of 100 l. per Annum, or the Reversion of such an Estate for ever after the Expiration of the said 15 Years; computing at the Rate of 5 per Cent. per Annum Compound Interest?

An Estate of 100 l. per Annum, in Fee } Simple at 5 per Cent. is Worth —	} l. 2000
In Table V. the present Value of the same Estate, at the same Rate, for 15 Years, is	} l. 1037,9658

The Difference is l. 962,0342

Now this Difference being the Value of the Reversion, it appears that the first Term of 15 Years is better than the Reversion for ever afterwards by 75,9316 l. = 75 l. 18 s. 7½ d. Answer.

Question 5.

A Person having 12 Years to come, in a Lease of an Estate of 60 l. per Annum for 40 Years, would know what present Money he must pay in order to renew or complete the Lease by adding 28 Years thereto, computing at 6 per Cent. Compound Interest?

By Table V. the present Value of 1 l. per Annum, at 6 per Cent. for 40 Years, is	} l. 15,046297
By the same Table the Value of 1 l. per An. at that Rate, for 12 Years to come, is	} l. 8,383844

The Difference is l. 6,662453  
Which multiplied by 60

The Product is the Answer, viz. — l. 399,747180  
In Money, 399 l. 14 s. 11 d.

Question

230 *The Nature, Construction, and Use*

*Question 6.*

*A* gives 1550 *l.* for an *Annuity* of 100 *l.* per *Annum* for 50 Years. *B* puts 1550 *l.* out at *Interest*. It is required to know which will amount to the greatest Sum at the End of the 50 Years, at the Rate of 6 *l.* per Cent. &c. Compound *Interest*?

By *Table IV.* the Amount of 100 *l.* *Annuity*, in 50 Years, at 6 per Cent. } *l.* 29033,59046  
may be found to be — — —

By *Table II.* it may be found, that the Amount of 1550 *l.* for that Time and Rate will be — — — } *l.* 28553,23883

Hence *A's Annuity* is more than *B's* 1550 *l.* by *l.* 482,35161 at the End of 50 Years. The present Value of which Difference is found, by *Table III.* to be 26 *l.* 3 *s.* 8  $\frac{1}{2}$  *d.* and so much was *A's Case* better than *B's*,

*Question 7.*

What *Annuity* to continue 14 Years, may be purchased with 1000 *l.* due at the end of 5 Years; the *Annuity* to commence presently, at 5 *l.* per Cent.?

By *Table III.* the present Worth of 1000 *l.* due 5 Years hence at 5 per Cent. } = *l.* 783,5262  
may be found — — —

By *Table VI.* it may be found, that the *Annuity* which 783,5262 *l.* will purchase for 14 Years, at the Rate of 5 per Cent. is } = *l.* 79,1518

In Money, 79 *l.* 3 *s.* 0  $\frac{1}{4}$  *d.* per *Annum*, the Answer.

*Question 8.*

For a *Lease* of certain Profits for 7 Years, *A*, makes two Offers, either to pay 150 *l.* as a *Fine*, and 300 *l.* per *Annum*; or 1700 *l.* *Fine*, without any *Rent*. *B*, bids 650 *l.* *Fine*, and 200 *l.* per *Annum*. And *C*, offers 200 *l.* *Fine*, and 405 *l.* per *Annum*. Quere which is the best Offer, and what the Difference, computing at 5 *l.* per Cent. &c. Compound *Interest*?

1. By

of the Dec. Tables of Comp. Interest. 231

1. By Table II. the Amount of 150*l.* in }  
 7 Years, at 5 per Cent. may be found to be } *l.* 211,0659  
 By Table IV. the Amount of 300 *l.* per }  
 Annum in 7 Years at the given Rate may } *l.* 242,6025  
 be found — — — — —

Therefore A's Offer, at the End of 7 Years }  
 would be — — — — — } *l.* 2453,6684

2. By Table II. the Amount of 1700 *l.* in }  
 7 Years (A's second Offer) at the said Rate, }  
 is found to be — — — — — } *l.* 2392,0802

3. By Table II. the Amount of 650 *l.* in }  
 7 Years, at the given Rate, will be found }  
 to be — — — — — } *l.* 914,6189

By Table IV. the Amount of 200 *l.* per }  
 Annum in 7 Years, at that Rate, will be }  
 found to be — — — — — } *l.* 1628,4016

Therefore B's Offer will, in 7 Years, a- }  
 mount to — — — — — } *l.* 2543,0205

4. By Table II. the Amount of 200 *l.* in }  
 7 Years, at the given Rate, will be found }  
 to be — — — — — } *l.* 281,4212

By Table IV. the Amount of 405 *l.* per }  
 Annum for the given Time and Rate, will }  
 be found to be — — — — — } *l.* 3297,5132

So that C's Offer, in 7 Years, will amount to *l.* 3578,9344

The Amounts therefore of the said Offers, at the End of  
 the said Term, being thus known; the Present Worth of the  
 several amounts may be found by Table III. which are as  
 follow.

	<i>l.</i>	<i>s.</i>	<i>d.</i>
The present Worth of A's first Offer will be	1885	18	03
A's second Offer	1700	00	00
B's Offer	1807	05	06
C's Offer	2543	09	08

Therefore the present Worth of what C offers is more  
 than — — — — — *l.* *s.* *d.*  
 A's first Offer, by 657—11—5  
 A's second Offer, by 843—9—8  
 B's Offer, by 736—4—2

Which fully answers the Question.

N. B. This

232 *The Nature, Construction, and Use*

*N. B.* This Question might be more readily answered by finding the *present Worths* of the several offer'd *Annuities* (as per *Table V.*) and adding to them the several *Fines*; as the Reader may try at his *Leisure*.

*Question 9.*

What *Annuity* is sufficient to pay off a *Debt* of 50 *Millions* in 30 *Years* at 4 *l. per Cent. Compound Interest*?

In *Table IV.* against 30 *Years*, under 4 *per C.* is 0578301  
Which multiply by the *Debt* — 50000000

The *Product* is the *Annuity sought*, viz. *l.* 2891505  
*per Annum.*

So that supposing the *National Debt* to be 50 *Millions*, and the *Interest* paid to be 2 *Millions per Annum*, or 4 *l. per Cent.* then will a *Sinking Fund* of 891505 *l. per Annum*, clear the whole *Debt* in 30 *Years*.

*N. B.* By this Example appears the *Necessity* of continuing the *Tabular Numbers* to so many *Places of Decimals*.

*Question 10.*

Suppose one *Farthing* had been lent at *Compound Interest* at 5 *per Cent.* in the *first Year* of the *Christian Æra*, or *Birth of Christ*, and so continued to this *present Year* thereof 1734; *Quere* the *Amount* thereof?

*N. B.* Though this Question might be answered by *Table II.* as I have before shewn, yet I shall here use *Logarithms*, as most expeditious in this Case. For having said enough about the *Use* of the *Tables*, I here intend only to give the Reader a hint of the *surprising Nature* of *Numbers* in *Geometrical Proportion*.

*l.*

Therefore, The <i>Logarithm</i> of the <i>Rate</i>	1,05 = 0,0211893
Multiplied by the <i>Time</i>	— — 1734
The <i>Product</i> is	— — 36,7422462
To which add the <i>Logarithm</i> of 1 <i>Farthing</i> , or the ,0010418 Part of a <i>Pound</i> ,	}
<i>viz.</i>	
	= 7,0177288
The <i>Sum</i> is the <i>Log.</i> of the <i>Amount sought</i> = 33,7599750	
	<i>Now</i>

Now the *Index* of this *Logarithm* being 33, shews the *Number* of *Figures*, of which the *Amount* of one *Farthing* in the given *Time* doth consist; to be 34; of which let it be sufficient to express the 4 first in *Figures*; the Rest in *Cyphers*; then will the said *Amount* be

57540000000000000000000000000000 l.

Now the *Value* of a *solid Body*, perfectly *Spherical*, whose *Diameter* is 8000 *English Miles*, (which is somewhat bigger than the *Diameter* of the *Globe* of our *Earth*.) I say such a *solid Body* of *fine Gold* would be in *Value* about

238660000000000000000000000000 l.

Now if from each of these *great Numbers*, be cut off 23 *Cyphers*, the *remaining Figures* will be 5754000000 in the *Amount* of the *Farthing*; and 23866 in the *Value* of the *Globe* of *Gold*. But 23866) 5754000000 (= 2400000 nearly.

Hence it appears, That one *single Farthing* put out to *Usury* in the *Manner* aforesaid would amount to more in *Value* than *two Millions* and *four hundred Thousand Globes* of *fine solid Gold*, each bigger than the *Globe* of the *Earth*! A *strange* and *surprising*, but no less *certain Truth*! And this *immense Amount* would be greatly increased by enlarging the *Rate of Interest*.

I shall now conclude this *Part*, by presenting the *Reader* with a *small Table* concerning the *present Worth* or *Value* of *Estates* upon *Lives*, with its *Use*; This *Table* was at first composed by the *Great and Learned Dr. Halley*, for every *Fifth Year* of *Age* to the 70th, as follows.

Age	Year's Purchase	Age	Year's Purchase	Age	Year's Purchase
1	10,28	25	12,27	50	9,21
5	13,40	30	11,72	55	8,51
10	13,44	35	11,12	60	7,60
15	13,33	40	10,57	65	6,54
20	12,78	45	9,91	70	5,32

*The Use of the TABLE.*

Suppose a Person of 50 Years of Age offers to sell his Life in an Estate of 46*l.* per Annum, what is the Value thereof in Ready Money.

The Age of 50, is Years Purchase ——— 9,21  
 Which multiply by the Annuity ——— 46  
 The Product is the Answer 423*l.* 23*s.* 2*d.* = 423,66

If it happen that a Life and a Reversion for so many Years after, be offered; 'twill be necessary to reduce the Year's Purchase into Years certain, or Years of a Lease, by the *Profitable* Table; thus, Suppose I would find what Number of certain Years corresponds to 50,57 Years Purchase, and 6 per Cent. I look in *Table V.* under the given Rate, and I find the next nearest Value of Annuity of 1*l.* per Annum to 50,57, to be 20,4772597, opposite to which is 17 Years, which are to be added to the Years in Reversion, and then the Case is thus easily solved. *Example.*

What is the present Worth of an Estate of 78*l.* per Annum clear Rent for 20 Years after the Death of a Person 40 Years of Age, at 6 per Cent?

The Age of 40 Years is 10,57 Years purchase, which in *Table V.* gives 17 Years certain to come at 6 per Cent.  
 Then 20 + 17 = 37 Years.

Years. 1.  
 Therefore the present Worth of 1*l.* for 37 = 4,7367804  
 per Annum for the given Rate — 5 for 17 = 20,4772597

The present Worth of 1*l.* per Annum for 20 = 4,2595207  
 Which multiply by the Annuity ——— 78

The Prod. is the Answer 232*l.* 4*s.* 11*d.* = 232,2426146

## TABLES of COMPOUND INTEREST.

## TABLE I.

The Amount of one Pound for Days; at the Rates of 2;  $2\frac{1}{2}$ ; 3;  $3\frac{1}{2}$ ; 4;  $4\frac{1}{2}$ ; 5, and 6 per Cent. per Annum.

Days.	2 per C.	$2\frac{1}{2}$ per C.	3 per C.	$3\frac{1}{2}$ per C.
1	1,0000542	1,0000676	1,0000809	1,0000942
2	1,0001085	1,0001353	1,0001619	1,0001885
3	1,0001627	1,0002029	1,0002429	1,0002827
4	1,0002170	1,0002706	1,0003240	1,0003770
5	1,0002713	1,0003383	1,0004050	1,0004713
6	1,0003255	1,0004059	1,0004860	1,0005656
7	1,0003798	1,0004736	1,0005670	1,0006600
8	1,0004341	1,0005412	1,0006480	1,0007542
9	1,0004884	1,0006089	1,0007291	1,0008486
10	1,0005426	1,0006767	1,0008101	1,0009429
20	1,0010856	1,0013539	1,0016209	1,0018867
30	1,0016289	1,0020315	1,0024324	1,0028315
40	1,0021725	1,0027097	1,0032445	1,0037771
50	1,0027163	1,0033882	1,0040572	1,0047236
60	1,0032605	1,0040673	1,0048708	1,0056710
70	1,0038049	1,0047468	1,0056849	1,0066193
80	1,0043497	1,0054267	1,0064996	1,0075685
90	1,0048947	1,0061071	1,0073151	1,0085186
100	1,0054401	1,0067880	1,0081311	1,0094696
110	1,0059857	1,0074693	1,0089479	1,0104214
120	1,0065316	1,0081511	1,0097653	1,0113742
130	1,0070779	1,0088334	1,0105834	1,0123279
140	1,0076244	1,0095161	1,0114021	1,0132825
150	1,0081712	1,0101993	1,0122215	1,0142379
160	1,0087183	1,0108829	1,0130415	1,0151943

**T A B L E I.**

*The Amount of one Pound, Compound Interest.*

<i>Days.</i>	<i>4 per C.</i>	<i>4½ per C.</i>	<i>5 per C.</i>	<i>6 per C.</i>

## C H A P. X.

The Use of DECIMALS in Vulgar, Duo-  
decimal, and Sexagesimal Fractions.

---

*Vulgar Fractions in Decimals.*

I HAVE already shewn the Method of finding the Decimal equivalent to any *Vulgar Fraction*, in *Reduction*; What I propose here, is to shew with how much greater Ease and Pleasure any of the Operations of *Vulgar Fractions* are wrought by *Decimal Numbers*. I shall exemplify the Matter in the *common Rules* as follows.

*Addition.*

*Example 1.* What is the Sum of  $\frac{7}{9}$  and  $\frac{2}{7}$  of a Pound?

Add  $\left\{ \begin{array}{l} \text{The Decimal of } \frac{7}{9} = ,777 \\ \text{The Decimal of } \frac{2}{7} = ,285 \end{array} \right\}$  By the general  
Decimal Table,  
P.

The Sum of both is  $= l. 1,2062 = 1l. 4s. 1\frac{1}{2}d.$  Anf.

*Example 2.* What is the Value of  $\frac{1}{16}$  and  $\frac{5}{6}$  of a Shilling?

Add  $\left\{ \begin{array}{l} \text{The Decimal of } \frac{1}{16} = ,0625 \\ \text{To the Dec. of } \frac{5}{6} = ,8333 \end{array} \right\}$  By the said Ta-  
ble.

Their Sum is  $= 0,8958\bar{3} = 10\frac{1}{4}d.$  Anf.

260 *The Use of Decimals in the*

*Example 3.* What is  $\frac{2}{13}$ ,  $\frac{3}{13}$  and  $\frac{7}{13}$  of a Yard?

Add {	The Decimal of	$\frac{2}{13} =$	,1538	} By the Tab.
	And the Dec. of	$\frac{3}{13} =$	,2307	
	And the Dec. of	$\frac{7}{13} =$	,5384	

The Sum, of Course, is  $\frac{12}{13} = 0,9239 = 2 \text{ F. } 9 \text{ In. An.}$

*Example 4.* What is the Value of  $\frac{2}{3}$ ,  $\frac{4}{5}$ ,  $\frac{2}{9}$ , and  $\frac{3}{4}$  of  $\frac{5}{6}$  of a Hundred Weight Averdupois?

Add {	The Decimal of	$\frac{2}{3} =$	,6666	} By the Table.
	The Decimal of	$\frac{4}{5} =$	,8000	
	The Decimal of	$\frac{2}{9} =$	,2222	
	The Dec. of $\frac{3}{4}$ of $\frac{5}{6}$	$= \frac{5}{8} =$	,6250	

The Sum of all is —  $C. 2,3138 = 2 : 1 : 7 : 2$  *C. Q. lb. oz.*

*Example 5.* What Number of Years, do  $476\frac{7}{11}$ ,  $36\frac{9}{10}$ ,  $21\frac{10}{11}$ ,  $7\frac{13}{14}$ ,  $1\frac{14}{17}$  and  $\frac{17}{19}$  of a Year, make?

$$476\frac{7}{11} = 476,6363 \text{ Years.}$$

$$36\frac{9}{10} = 36,9000$$

$$21\frac{10}{11} = 21,9090$$

$$7\frac{13}{14} = 7,9285$$

$$1\frac{14}{17} = 1,8234$$

$$\frac{17}{19} = 0,8944$$

These mixed Fractions being set down in order, and the Decimals of the Fractional Parts being found in the General Table and set down opposite thereto; add them, and their Sum will be

545,7541 Years.

That is, 545 Years, 9 Months, 3 Weeks, and 2 Days nearly. *Subtraction.*

*Subtraction.*

*Example 1.* What is  $\frac{5}{6}$  less  $\frac{2}{8}$  of a *Pound Sterling*?

From	—	—	$\frac{5}{6} = ,833$	}	By the general Decimal Table.
Subtract	—	—	$\frac{2}{8} = ,25$		
There remains	—	—	$0,458\bar{3} = 9s. 2d.$ Ans.		

*Example 2.* What is the Value of  $\frac{2}{3}$  of  $\frac{7}{8}$  less  $\frac{3}{4}$  of  $\frac{5}{9}$  of a *Rod*?

From	—	—	$\frac{2}{3}$ of $\frac{7}{8} = \frac{7}{12} = ,58\bar{3}$	}	By the Table.
Subtract	—	—	$\frac{3}{4}$ of $\frac{5}{9} = \frac{5}{12} = ,41\bar{6}$		
There remains	—	—	$0,16\bar{7} = 0Y. 2F. 9In.$		

*Example 3.* What is  $14\frac{2}{9}$ , less  $\frac{5}{7}$  of a *Pound Troy*?

From	—	—	$14\frac{2}{9} = 14,222\bar{2}$	}	By the Table.
Take	—	—	$\frac{5}{7} = 0,714\bar{2}$		
There remains	—	—	$13,508\bar{0} = 13 : 6 : 2$		

*Example 4.* What is  $170\frac{17}{19}$ , less  $159\frac{9}{19}$  *C. Weight, Averdupois*?

From	—	—	$170\frac{17}{19} = 170,8947$	}	By the Table.
Take	—	—	$159\frac{9}{19} = 159,4736$		
There remains the Answer	—	—	$11,4211$ C.		

*Multi.*

Multiply the Length —  $10\frac{1}{6} = 10,1\bar{6}$

By the Width — —  $5\frac{4}{11} = 5,3\bar{6}$

That Product will be — —  $54,526\bar{20}$

Multiply that by the Depth —  $4\frac{5}{9} = 4,5\bar{5}$

The Product is the Solid Content }  
in Feet and Parts — } = 248,3976 Sc.

Multiply that by the Gallons in }  
a Solid Foot; viz.  $6\frac{13}{32}$  } = 6,40625

The Product is the Number of }  
Corn Gallons sought, viz. } = 1591,2969 Sc.

*Note* ; When there is given any Number of pure Fractions to be multiplied into one another; You may multiply the *Numerators* and *Denominators* into one another, and the Products will be a Fraction, whose Value in *Decimals* you may find as before taught,

Thus, { Multiply  $\frac{1}{9}, \frac{2}{7}, \frac{5}{11}, \frac{9}{17}$  all into one another.  
Then  $1 \times 2 = 2, 2 \times 5 = 10, 10 \times 9 = 90$  }  $\frac{10}{1309}$   
And  $9 \times 7 = 63, 63 \times 11 = 693, 693 \times 17 = 11781$  }  
But  $\frac{10}{1309} = 0,00764$  The Answer

*Division.*

*Example 1.* Divide  $\frac{5}{7}$  by  $\frac{3}{17}$

The

264 *The Use of Decimals in the*

Thus  $\frac{1}{17} = 0,0588) ,214288 = \frac{5}{7} (12,14754 = \text{The Answer.}$

$$\begin{array}{r}
 588 \\
 \hline
 1262 \\
 1176 \\
 \hline
 \dots 868 \\
 588 \\
 \hline
 2805 \\

 \hline
 1616 \\
 1536 \\
 \hline
 \dots 808
 \end{array}$$

There is somewhat remarkable and uncommon in the Work of this Question, viz. First, that the 1st, 3d, 5th, &c. Remainders, with the Numbers taken down, consist of 2 Pair of the same Figures; Secondly, That the 2d, 4th, &c. Remainders, with the Figures taken down, are just half the others; Thirdly, That where the Remainders of Pairs are prime Numbers, the next is a Remainder is a Pair of even Numbers, and then goes on as before, as at the 5th and 6th.

*Ex.*

## The Use of Decimals in the

### Extraction of Roots.

**Example 1.** What is the Square Root of  $\frac{25}{36}$ ?

The Decimal of  $\frac{25}{36} = ,694(,833 = \frac{5}{6} =$  the Root  
(ought.

$$\begin{array}{r}
 64 \\
 163) \cdot 544 \\
 \underline{489} \\
 1663) \cdot 5544 \\
 \underline{4989} \\
 555
 \end{array}$$

**Example 2.** Required the Square Root of the Surd

Fraction  $\frac{13}{17}$ ?

The Decimal of  $\frac{13}{17} = ,7647058$  &c. the Root of which extracted will be  $,8744726$  &c. the Answer.

**Example 3.** Extract the Square Root of  $58\frac{7}{9}$

The Decimal of the mixed Fraction  $58\frac{7}{9} = 58,7$

Then extract thus;  $58,7 (7,86 = 7\frac{2}{3} =$  the Root  
(ought.

$$\begin{array}{r}
 49 \\
 146) \cdot 977 \\
 \underline{876} \\
 1526) 19177 \\
 \underline{9156} \\
 1021
 \end{array}$$

*Exam-*

*Example 4.* Extract the Cube Root of  $\frac{3}{16}$

This is best (as being vastly soonest and easiest) done by *Logarithms*, thus,

From the *Logarithm* of the Numerator 3 = 0,4771212  
Subtract the *Logar.* of the Denominator 16 = 1,2041200

There remains the *Lagar.* of the Dec. .1875 = 9,2730012  
Add to the *Index* of that *Logarithm* 20 — ,29,2730012

One Third of which *Logarithm* is }  
the *Logarithm* of the Root sought } 572358 = 9,7576670

The Cube Root then of  $\frac{3}{16}$  is ,572358 which was to be found.

*Example 5.* What is the Cube Root of  $512\frac{13}{15}$ ?

First, From the *Logarithm.* of the }  
Numerator of the Fractional Part } — 13 = 1,113943  
Subtract the *Logarithm.* of the Denominator 15 = 1,176091

There remains the *Logarithm* of the Dec. ,88 = ,9,9378;2  
To which add the *integral* Part 512

The Sum is the equivalent *mixed Dec.*  $512,88 = 2,710004$

A Third of whose *Logarithm* is }  
the *Logarithm* of the Cube Root } 8,0045 = 0,903334  
sought — — —

The Cube Root therefore of  $512\frac{13}{15}$  is 8,0045

*Not.* The Use of *Decimals* is not only very obvious in all Parts of the Doctrine of *Vulgar Fractions*, but absolutely necessary in *Extraction of Roots*; which sometimes else cannot be done.

### The Use of DECIMALS in Duodecimal Arithmetick.

*Duodecimals* are a Sort of *Fractions* made use of in *Mensuration*; Where one Foot is the *Integer*; The *Foot* is divided into twelve Parts or *Inches*; one of these, into twelve others, and so on dividing by twelve. Whence as ten is the *Common Denominator* in *Decimals*, so twelve is the *Common Denominator* in *Duodecimal Fractions*.

The Notation and Reading of *Duodecimals* is

Thus  $\left\{ \begin{array}{l} \text{Feet, Primes, Seconds, Thirds, Fourths, \&c.} \\ 15 : 69 : 10 : 66 : 11 \ \&c. \end{array} \right.$

Now because this kind of *Arithmetic* is useful to Persons concern'd in *Building, Measuring, \&c.* and the most useful Parts, viz. *Multiplication, Division, and Extraction*, being by far the most difficult; I thought it very proper (and hope it will be very acceptable) to shew how those Operations may be most easily and speedily perform'd by *Decimal Arithmetick*.

To that End I have made the following Table for the ready converting any *Duodecimals* into *Decimals*, and the contrary. The Use of which, to those who understand any *Decimal Tables* at all, is very obvious and easy.

### The Duodecimal Table.

Duodecimals.	The Decimal Parts.			
	Primes. '	Seconds "	Thirds. '"	Fourths. ""
1	,083333	,006944	,000578	,000048
2	,166666	,013888	,001157	,000096
3	,25	,020833	,001736	,000144
4	,333333	,027777	,002314	,000192
5	,416666	,034722	,002893	,000241
6	,5	,041666	,003472	,000289
7	,583333	,048611	,004051	,000337
8	,666666	,055555	,004629	,000386
9	,75	,0625	,005208	,000435
10	,833333	,069444	,005787	,000482
11	,916666	,076388	,006365	,000530

This Table, as I said, being so easy, needs no Instructions for its Use; nor shall I pretend to say *Decimals* are of any Service in the *Rules* of *Addition* and *Subtraction* of *Duodecimals*.

But

But their extream Utility in the aforesaid Operations of *Multiplication, Division, and Extraction of Roots, of Duodecimals*, will be undeniably evident by the ensuing Examples.

*Multiplication.*

*Example 1.* What is 9 F, 10' multiplied by 8 F. 08' ?

$$\begin{array}{r}
 \text{Multiply the Decimal of } 9 : 10 = 9,83 \\
 \text{By the Decimal of } 8 : 08 = 8,6 \\
 \hline
 9) 5900 \\
 \hline
 6555 \\
 \hline
 \text{The Product is the } \} \text{ Feet} \quad 78666
 \end{array}$$

Answer, viz.  $\int 85 : 2 : 8 = 85,222 \text{ Feet.}$

*Example 2.* What is the Product of 40 F. 09' : 10" : by 11' : 09" ?

$$\begin{array}{r}
 \text{Multiply the Decimal of } 40 : \overset{\text{Feet}}{09} : 10 = 40,8194 \\
 \text{By the Decimal of } \quad \quad \quad 11 : 09 = \underline{,97916}
 \end{array}$$

In such Cases where the *Decimals* run far, and terminate in *Repetends*, 'tis best to multiply by the *contracted*, or *inverted* Way, heretofore taught, thus ;

$$\begin{array}{r}
 40,81944 \\
 61979,0 \\
 \hline
 3673750 \\
 285736 \\
 36737 \\
 468 \\
 272 \\
 \hline
 \hline
 \end{array}$$

Answer. 39 F. 11' : 07" : 06''' : 06 = 39,96903 Feet.

*Example*

Division.

Example 1. Divide 12 Feet, 10' : 07" : by 3.  
 Thus, the Decimal of 12 Feet, 10' : 07" is 12,88194

Then 3) 12,88194 (4,2939814 = 4 : 03 : 06 : 04

$$\begin{array}{r}
 12 \\
 \hline
 \cdot\cdot 8 \\
 6 \\
 \hline
 28 \\
 27 \\
 \hline
 11 \\
 9 \\
 \hline
 29 \\
 27 \\
 \hline
 24 \\
 24 \\
 \hline
 \cdot\cdot 4 \\
 3 \\
 \hline
 14 \\
 12 \\
 \hline
 24
 \end{array}$$

Ad Infinitum.

Example 2. Divide 14 Feet, 07' : 09" : by 06' : 04"

The Decimal of { 14 : 07 : 09 = 14,64583  
 06 : 04 = ,527

Then ,527) 14,64583  
 52 146458

475) 13,18125 (27,75 = 27 Feet, 09"

$$\begin{array}{r}
 950 \\
 \hline
 \cdot 3681 \\
 - 3325 \\
 \hline
 \cdot 3562 \\
 3325 \\
 \hline
 2375 \\
 2375 \\
 \hline
 \dots
 \end{array}$$

Exam-

The Use of Decimals in

Example 3. Divide 5 Feet, by 1 Foot, 02' : 03" : 11'''

The Decimal of 1 Foot, 02' : 03" : 11''' = 1,193865  
 Then 1,193865) 5,000000 (4,188079 =  
 4 775460 (4 F. 02' : 03" : 01'''

 ::

Extraction

*Extraction of Roots.*

*Example 1.* What is the Side of the Square of

$$F. \quad 163 : 11 : 05 : 01 : 09 ?$$

The *Decimal* of those *Duodecimals* is 163,95239, the *Square Root* of which extracted either by *Logarithms* or in the common way, gives the Side 12 : 09 : 07 : 10 for Answer.

*Example 2.* What is the Side of the Cube, whose Solid

$$F. \quad \text{Content is } 1 : 10 : 07 : 06 : 10 ?$$

By *Logarithms*

$$F. \quad \text{Thus, the Decimal } 1 : 10 : 07 : 06 : 10 = 1,885898$$

$$\text{Then the } \textit{Logarithm} \text{ of } \text{---} 1,885898 = 0,2755182$$

$$\text{One Third of that is } \text{---} 1,23549 = 0,0918394$$

But 1,23549 is the *Decimal* of 1 : 02 : 09 : 10 : 11  
Which is the Length of the Side of the Cube proposed.

As in *Vulgar*, so in *Duodecimal Fractions*, the *Extraction* of Roots, can be performed, no way so well as by *Decimal* Parts ; and the other *Laborious Operations* are hereby rendered easy and concise.

*The Use of Decimals in Sexagesimal Arithmetick.*

*Sexagesimals* are those *Fractions* which have 60 for their common *Denominator* ; and are chiefly used in *Computations* of *Motion* and *Time*.

Hence this Kind of *Arithmetick* is proper to *Astronomy*, which, as it is a Science of *Motion*, and *Time*, makes use thereof in all its *Calculations*: Hereby it is the *Astronomer* calculates the *Motion*, *Place*, *Magnitude*, *Distance*, *Time*, *Aspects*, and other *Phanomena* of the *Heavenly Bodies* ; the *Sun*, *Moon*, *Planets*, *Comets*, and *Stars*.

The Notation and Reading of *Sexagesimals* is in this Manner following ;

Viz.  $\left\{ \begin{array}{l} \text{Signs, Degrees, Minutes, Seconds, Thirds, \&c.} \\ \text{C } 05 : 26 : 57 : 53 : 47 \text{ \&c.} \end{array} \right.$

And as 60 is one *Degree* of *Motion*, so it is one *Hour* of *Time* ; hence *Sexagesimals* properly so called, begin only at *Minutes*, and go to *Seconds, Thirds, \&c.* forwards, in both *Motion*, and *Time* ; though in common, it comprehends any *Division* of either.

But as all *Astronomical* Calculations are made from *Sexagesimal* Numbers, already computed and disposed into *Tables* of various Sorts ; if I would shew or demonstrate the Use of *Decimals*, and their Preference to *Sexagesimal Numbers* in these Kind of Computations ; I must first suppose those *Sexagesimal* Tables, made into *Decimal* ones ; and if such a thing were once done, I believe 'twould be no very hard Task to make good the Proposition asserted.

The Reader need only judge of this by the following Example of *Addition* in both *Species*.

	<i>Sexagesimally.</i>	<i>Decimally.</i>
S.	6	S
03 :	21 :	3,73211
11 :	57 :	11,99331
10 :	47 :	10,63311
09 :	59 :	9,84317
08 :	17 :	8,99996
11 :	43 :	11,62433
Sum 08 :	49 :	8,82601
	24 :	
	46 :	
	53 :	

In this *Specimen* I think 'tis easy to observe how concise, simple, natural and easy the Operation by *Decimals* is if compared with the *Sexagesimal* Process ; which therefore I think must needs prove the Preference and Excellency of those Tables in *Decimals*.

But since none as yet have said any thing about this Affair, nor have we any *Astronomical* Tables in *Decimals*, I shall give a *Specimen* thereof in the *Mean Motions* of all the *Planets* for one whole *Year, Day, Hour, and Minute*, in the Table subjoin'd.

*Planets*

<i>Planets.</i>	<i>A Year.</i>	<i>A Day.</i>	<i>An Hour.</i>	<i>A Minute.</i>
	S.	S.	S.	S.
<i>Sun</i>	11,99025	0,03285	0,001367	0,000018
<i>Moon</i>	4,31271	0,43921	0,078292	0,000294
<i>Saturn</i>	0,40709	0,0011	0,000046	0,000000
<i>Jupiter</i>	1,01096	0,00276	0,000110	0,000000
<i>Mars</i>	6,37574	0,01749	0,000728	0,000009
<i>Venus</i>	7,49255	0,05840	0,00122	0,000036
<i>Mercury</i>	1,79005	0,13639	0,005683	0,000092

Such then is the Form, and such would be the Difference of *Decimal* and *Sexagesimal Tables*; The Numbers here are *homogeneous*, all of one Sort; in them, they are *heterogeneous*, or consist of diverse Sorts; here they are *Uniform* and to be wrote as *integral* Numbers, these they are ranged in a different Form and in diverse *Classes*, as all mixed Numbers are; besides the great Ease and Facility of Working *Decimal* in Comparison of *Sexagesimal* Numbers, as I before observed. Upon all these Accompts, and several others I might mention, A Set of *Astronomical Tables* in *Decimal Numbers* must certainly be much more Useful, and every way preferable to the present *Sexagesimal Tables*.

After having turn'd your *Sexagesimal Numbers* into *Decimals*, they are to be worked in the same Manner as *Duodecimals* through all the *Rules*, as is there taught; and therefore needs not be here again repeated. Only, I would here observe, that the *Rules* of *Multiplication* and *Division*, which are here often necessary, cannot be perform'd without a great deal of Difficulty, or a long and tedious Process, whereas by *Decimals* 'tis done with the utmost Facility and Expedition.

To this End, I have taken Care that the Reader should not want large and sufficient Tables for the expeditious turning of his *Sexagesimals* into *Decimals*, and the contrary; the like of which are not to be found elsewhere, that I know of.

## C H A P. XI.

The Use and Management of DECIMALS  
(after a new Manner) by Logarithms.

**T**HERE may chance to happen to the Reader a *double* Advantage in this Chapter; for first, he may here perceive, not only the common, but an *entire new* Management of *Decimals* by *Logarithms*; and *secondly*, he may here as well as any where learn the whole noble and excellent *Art* of *Logarithmical Arithmetick*, if he has not learnt it already; for *Decimals* and *Integers* having the same essential Properties, the *Logarithms* of both are the same, and differ only in their *Indexes*.

But that the *young Student* may the better understand how to vary and adjust the *Index* of the *Logarithm*, I have in the following Table given *all Variety of Cases* that can happen to a Number, its *Logarithm*, and *Index*, under the various Conditions, and Denominations of *Whole Number*, *Mixed Number*, *Pure Decimal*, *Repeating Decimals*, *Decimals* with *Cyphers* prefixed, &c. as follow.

			<i>Index Logar.</i>
<i>Whole Numbers</i>	—	5243	= 3,7195799
<i>Mixed Numbers</i>	—	}	524,3 = 2,7195799
			52,43 = 1,7195799
			5,243 = 0,7195799
<i>A Perfect Decimal</i>	—	,5243	= 9,7195799
<i>Decimals with Cyphers prefixed</i>	}	,05243 = 8,7195799	
		,005243 = 7,7195799	
		,0005243 = 6,7195799	
<i>A Single Repetend</i>	—	3,	= 0,5228787
<i>Mixed Single Repetends</i>	}	43,3 or 43 = 1,6368221	
		243,3 or 243 = 2,3862016	
		5243,3 or 5243 = 3,7196075	
<i>Compound Repetends</i>	—	}	4,3 = 0,6378333
			2,43 = 0,3860408
			3,243 = 0,7196234

Com-

		<i>Index Logar.</i>
Compound Repetends with Cyphers	}	,00003 = 5,5228787
		,00043 = 6,6378333
		,00243 = 7,3860408
		,05243 = 8,7196234
Mix'd Compound Repetends	{	243 = 2,3863818
		52,43 = 1,7196000
The same with Cyphers	{	,000243 = 6,3863818
		,005243 = 7,7196000

From this general *Scheme*, the following *Observations* may be made relating to the *Logarithm*, and determining its *Index* for any Kind of Number.

*Observation 1.* That the *Index* of the *Logarithm* of any whole Number, is always one less than the Number of Places of Figures in the whole Number.

*Observation 2.* That the *Logarithm* of any Number, whether *Integral*, *Mix'd*, or wholly *Decimal*, is the very same; only the *Index* differs and must be adjusted solely in regard of the *integral* Part of the Number; as *per Observ. 1.*

*Observation 3.* That if there be no *integral* Part but the Number is entirely *Decimal*, and the first left-hand Figure be one of the *nine Digits*, the *Index* is (0).

*Observation 4.* That if the Number be entirely *Decimal*, and have any Number of Cyphers prefixed, the *Index* (being in this Case dotted on both sides) must be such as, when subtracted from 9, the Remainder may express the Number of Cyphers prefixed.

*Observation 5.* That any *Repetend*, or Set of *Circulating* Numbers, whether *Whole*, or *Decimal*, observe all the Rules of *terminate* Numbers aforementioned, relating to the *Index*; but the *Logarithm* is different.

*Observation 6.* That the *Logarithm* varies, according as the same Figures are either *terminate* or *repetends*; and again as those *Repetends* make either a *Part*, or the *Whole Number*; or thus, the *Logarithm* is bigger or less as the first Figure of the *Repetend* is so.

As to what concerns the *Adding* and *Subtracting* of *Indexes*, that may be thoroughly understood by the following *Table* of all the *Varieties* that can happen in that *Affair*.

*Addi.*

## 278 *The Use and Management of Decimals*

### *Addition.*

$$\begin{array}{r} 1. \text{ To } - 2,5132176 \\ \text{Add } - 1,8061800 \\ \hline \text{Sum } = 4,3193976 \end{array}$$

$$\begin{array}{r} 2. \text{ To } - 3,3916407 \\ \text{Add } - 5,2041200 \\ \hline \text{Sum } = 8,5957607 \end{array}$$

$$\begin{array}{r} 3. \text{ To } - 2,2671717 \\ \text{Add } - 8,1414498 \\ \hline \text{Sum } = 10,4086215 \end{array}$$

$$\begin{array}{r} 4. \text{ To } - 8,5132176 \\ \text{Add } - 3,8061800 \\ \hline \text{Sum } = 12,3193976 \end{array}$$

$$\begin{array}{r} 5. \text{ Add } \left\{ \begin{array}{l} 9,2671717 \\ 5,5132176 \\ 8,8061800 \end{array} \right. \\ \hline \text{Sum } = 23,5865693 \end{array}$$

### *Subtraction.*

$$\begin{array}{r} 1. \text{ From } - 4,3193976 \\ \text{Subtract } 1,8061800 \\ \hline \text{Rem. } = 2,5132176 \end{array}$$

$$\begin{array}{r} 2. \text{ From } - 18,5957607 \\ \text{Take } - 3,3916407 \\ \hline \text{Rem. } = 15,2041200 \end{array}$$

$$\begin{array}{r} 3. \text{ From } - 10,4086215 \\ \text{Take } - 8,1414498 \\ \hline \text{Sum } = 2,2671717 \end{array}$$

$$\begin{array}{r} 4. \text{ From } - 12,3193976 \\ \text{Take } - 3,8061800 \\ \hline \text{Sum } = 8,5132176 \end{array}$$

$$\begin{array}{r} 5. \text{ From } - 23,5865693 \\ \text{Take } - 9,2671717 \\ \hline \text{Sum } = 14,3193976 \end{array}$$

To understand the better what concerns the Ordering and Adjusting the *Indices*, in the foregoing Examples, I have sub-join'd the following *Scheme* of the Number of Cyphers, and their corresponding *Indices*.

*Numb. of Cy.* 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, &c.  
*Their Indic.* 9, 8, 7, 6, 5, 4, 3, 2, 1, 0, 19, 18, 17, 16, 15, &c.

Hence observe, In *adding Indices*, 1. If both be *Affirmative*, their *Sum* is *Affirmative*. 2. If both be *Negative*, and the *Sum* be under 10, add 10 thereto; but if above 10, or just 10, cast away 10; the *Remainder* is *negative*. 3. If one *Index* be *affirmative*, and the other *negative*; the *Sum* if under 10 is *negative*; if just 10, or above 10, cast 10 away; the *Remainder* is *affirmative*.

In

In *Subtracting Indices*, observe, 1. If they are both *Affirmative*, and the Higher be the *Greater*, the Remainder is *Affirmative*; if the Lower be the *Greater*, the Remainder is *Negative*, (10 being added to the *higher*.) 2. If one or both be *Negative*, and the *higher* smaller than the *lower*, add 10 to it; than if the *higher* be of *greater Value*, the Remains are *Affirmative*; if not, they are *Negative*.

In order to understand the *Art* of Logarithms, and the dexterous Management of Numbers (more particularly *circulating Decimal Numbers*) thereby, 'twill be absolutely necessary to understand, and that perfectly well, the following *Logarithmical Problems*.

**Problem 1.** To find the *Arithmetical Complement* of any given *Logarithm*.

**Rule.** Begin at the Left-hand to subtract (*mentally*) each Figure from 9, and the last of all from 10.

**Exam.** What is the *Arithm. Compl.* of the Log. 3,8649262  
 Answer (*per Rule*) is = 6,1350738

**Problem 2.** To find the *Logarithm* of any *terminate Number* under 10000000.

**Rule.** Take the *Logarithm* out of the Tables to the *four first Figures* of any given Number of above *four Places*, and also the next *greater Logarithm*; then take the Difference of those two *Logarithms*, and multiply it by the remaining Figures of the given Number; from the Product cut off so many Places of Figures to the Right-hand, as were the remaining Figures above *four*; then add the other Part of the Product to the *Logarithm* of the *four Figures* first taken out of the *Canon*; that Sum is the *Logarithm* sought.

**Example.** Required the *Logarithm* of 1012659?

The *Logarithm* of —  $\begin{cases} 1012 = 3,0051805 \\ 1013 = 3,0056094 \end{cases}$

Their Difference — 4289  
 Multiply by the remaining Figures — 659

The Product (with 3 Places cut off) 2826,451

Which add to the *Logarithm* of 1012 = 3,0051805

The Sum is the *Logarithm* 6,0054631 sought.

*Problem*

## 280 *The Use and Management of Decimals*

**Problem 3.** A *Logarithm* being given, to find the Number belonging to the same.

**Rule.** Seek the next less *Logarithm* to the given one, in the Tables, and its four Figures are the first four of the Number required. Then take the Differences of the given *Logarithm* and the next less, and also the next greater and next less; Add to the first Difference, so many Cyphers as you seek Figures more than four. Divide That by the second Difference, and the Quotient annexed to the four Figures first found compleats the Number required.

**Example.** Required the Number of the given *Logarithm* 6,0054631?

The *Logarithm* next less is — 1012 = 3,0051805  
 The *Logarithm* next greater is — 1013 = 3,0056094  
 The Diff. of the given Log. and next less is = 2826  
 The Dif. of the next less, and next greater is = 4289

Then say, As 4289 : 2826 :: 1000 : 659, which annex to the first four Figures 1012, they compleat 1012659 the Number sought for the given *Logarithm*.

**Problem 4.** To find the *Logarithm* of any terminate Decimal Number.

**Rule.** Seek the *Logarithm* for it as though it were a whole Number, and then adapt the *Index* as before taught.

Thus the *Logarithm* of 1012,659 is 3,0054631, and of ,1012659 = ,9,0054631, &c.

**Problem 5.** To find the *Logarithm* of a single Reptend, or circulating Digit.

**Rule.** To the tabular *Logarithm* of the Digit, add the *Arithmetical Complement* of the *Logarithm* of 9, the Sum is the *Logarithm* sought.

**Example.** Required the *Logarithm* of 6?

To the *Tabular Logarithm* of 6 = 0,7781512  
 Add the *Arith. Complement* of the Log. 9 = 0,0457575  
 The Sum is the *Logarithm* sought of 6 = 0,8239087

In

In this Manner I have calculated the *Logarithms* of all the *Nine Digits perpetually circulating*, and disposed them ready for Use in the annexed *Table*.

Rep. Digits.	Logarithms.
1	= 0,0457575
2	= 0,3467875
3	= 0,5228787
4	= 0,6478175
5	= 0,7447275
6	= 0,8239087
7	= 0,8908555
8	= 0,9488475
9	= 1,0000000

*Problem 6.* To find the *Logarithm* of any pure *Compound Repetend*.

*Rule.* To the *Tabular Logarithm* of the *Number* (as terminate,) add the *Arithmetical Complement* of the *Logarithms* of so many *9's*, as are *Places* of the *Repetend*; the *Sum* is the *Logarithm* of the given *Repetend*.

*Example 1.* Required the *Logarithm* of the *Compound Repetend* 24?

To the *Tabular Logarithm* of — 24 = 1,3802112  
 Add the *Arithmetical Complement* of 99 = 0,0042648  
 The *Sum* is the *Logarithm* of — 24 = 1,3845760

*Example 2.* Required the *Logarithm* of 36,5?

To the *Tabular Logarithm* of — 36,5 = 1,5622929  
 Add the *Arithmetical Complement* of 999 = 0,0004345  
 The *Sum* is the *Logarithm* of — 36,5 = 1,5627274

*Example 3.* Required the *Logarithm* of 374<sup>6</sup>?

To the *Tabular Logarithm* of — 3746 = 3,5735678  
 Add the *Arithmetical Complement* of 9999 = 0,0000434  
 The *Sum* is the *Logarithm* of — 374<sup>6</sup> = 3,5736112

*Example 4.* Requir'd the *Logarithm* of 200,60?

To the *Tabular Logarithm* of — 200,60 = 2,3023309  
 Add the *Arith. Comp.* of the *Log.* of 99999 = 0,0000043  
 The *Sum* is the *Logarithm* of 200,60 = 2,3023352

*Note.* In all the foregoing *Examples* (and in those which follow) the *Indexes* of the *Arithmetical Complements* are omitted; and this must be observed by the *Learner* in all *Operations* of this kind.

*Problem 7.* To find the *Logarithm* of any *mixed Repetend*, either *Sing'e* or *Compound*.

*Rule.* From the given *mix'd Repetend*, subtract its *terminate Part*; Then to the *Logarithm* of the *Remainder* add the *Arithmetical Complement* of the *Logarithm* of so many *Nines*, as there are *Figures* in the *Repetend*, the *Sum* will be the *Logarithm* sought.

*Example 1.* Requir'd the *Logarithm* of 2,6?

From the given <i>Repetend</i>	—	2,6	
Subtract the <i>terminate Part</i>	—	2	
Then to the <i>Logarithm</i> of	—	2,4	= 0,3802112
Add the <i>Arith. Comp.</i> of the <i>Log.</i> of 9	=	0,0457575	= 0,4259687
The <i>Sum</i> is the <i>Logarithm</i> of	—	2,6	= 0,4259687

*Example 2.* Requir'd the *Logarithm* of 57,23?

From the given <i>Repetend</i>	—	57,23	
Subtract the <i>terminate Part</i>	—	572	
Then to the <i>Logarithm</i> of	—	51,51	= 1,7118915
Add the <i>Arith. Compl.</i> of the <i>Log.</i> of 9	=	0,0457575	= 1,7576490
The <i>Sum</i> is the <i>Logarithm</i> of	—	57,23	= 1,7576490

*Example 3.* Requir'd the *Logarithm* of 2,753?

From the given <i>Repetend</i>	—	2,753	
Subduct the <i>terminate Part</i>	—	27	
Then to the <i>Logarithm</i> of	—	2,726	= 0,4355258
Add the <i>Arith. Compl.</i> of the <i>Log.</i> of 99	=	0,0043648	= 0,4398906
The <i>Sum</i> is the <i>Logarithm</i> of	—	2,753	= 0,4398906

*Example*

*Example 4.* Requir'd the *Logarithm* of 725,6 ?

From	—	—	725,6	
Subduct	—	—	7	
To the <i>Logarithm</i> of		—	724,9	= 2,8602781
Add the <i>Arit. Compl.</i> of the <i>Log.</i> of			999	= 0,0004345
				2,8607126

The Sum is the *Logarithm* of — 725,6 = 2,8607126

*Example 5.* Requir'd the *Logarithm* of 26892,7 ?

From	—	—	26892,7	
Subtract	—	—	26	
To the <i>Logarithm</i> of		—	26890,1	= 4,4295924
Add the <i>Arit. Comp.</i> of the <i>Log.</i> of			9999	= 0,0000434
				4,4296358

The Sum is the *Logarithm* of — 26892,7 = 4,4296358

In the like Manner may the *Logarithm* of any other *Mix'd Repetend* be found, so far as the *Canon* of *Logarithms* (you use) will permit.

*Problem 8.* Between two Numbers given, to find any Number of *mean Proportionals* required.

*Rule.* Subtract the *Logarithm* of the lesser Number from the *Logarithm* of the greater; divide the Remainder by a Number greater by one than the Number of *Means sought*; this Quotient add to the *Logarithm* of the lesser Number; the Sum is the *Logarithm* of the first *Mean*; to which the said Quotient is to be added again for the *Logarithm* of the second *Mean*; and thus proceed for as many *Means* as you please.

## 284 *The Use and Management of Decimals*

*Example.* Between 8 and 56 to find four Mean Proportional Numbers.

The Logarithm of 56 is	—	—	1,7481880
The Logarithm of 8 is	—	—	<u>0,9030900</u>
The Remainder or Difference is	—	—	0,8450980
One fifth Part (for four Means) is	—	—	<u>0,1690196</u>
To which add the Logarithm of 8	—	—	<u>0,9030900</u>
The Sum is the Log. of the first Mean 11,809	—	—	= 1,0721096
To which add again	—	—	<u>0,1690196</u>
The Logarithm of the second Mean 27,42	—	—	= 1,2411292
Add again	—	—	<u>0,1690196</u>
The Logarithm of the third Mean is 25,71	—	—	= 1,4101488
Add again	—	—	<u>0,1690196</u>
Logarithm of the fourth and last Mean 37,94	—	—	= 1,5791684

This Problem I have chiefly inserted for their Sakes who would hereby learn to calculate *Tables of Compound Interest*; The Numbers in the Table of Amounts of 11. being only Mean Proportionals between the Logarithm of Rate and the last Year's Amount in the Table.

### *Multiplication of all Kinds of Decimals by Logarithms.*

*Rule.*  $\left\{ \begin{array}{l} \text{To the Logarithm of the Multiplicand,} \\ \text{Add the Logarithm of the Multiplier;} \\ \text{The Sum is the Logarithm of the Product.} \end{array} \right.$

*Example 1.* Multiply — 12,4 = 1,0934217  
 By — — 3,6 = 0,5563025  
 The Product — 44,64 = 1,6497242

*Example 2.* Multiply — 36,5 = 1,5622929  
 By — ,00019 = ,6,2787536  
 Product — ,006935 = ,7,8410465

*Example*

after a new Manner by Logarithms. 285

*Example 3.* Multiply — ,762 = 9,8819550  
 By — 570 = 2,7558748  
 Product — 434,34 = 2,6378298

*Example 4.* Multiply — ,0097 = 7,9867777  
 By — ,00021 = 6,3222193  
 Product — ,000002037 = 4,3089910

*Example 5.* Multiply — 26,4 = 1,4216039  
 By — 8 = 0,8239087  
 Product — 176 = 2,2455126

*Example 6.* Multiply — 2,73 = 0,4361626  
 By — 2,8 = 0,4259687  
 Product — 7,28 = 0,8621313

*Example 7.* Multiply — ,473 = 9,6748611  
 By — 83 = 1,8037053  
 Product — 39,8 = 1,4783664

*Example 8.* Multiply — 57,24 = 1,7576996  
 By — 2,793 = 0,4398906  
 Product — 177,61236 = 2,1975902

*Example 9.* Multiply — 8, = 0,8239087  
 By — 38 = 9,7447275  
 Product — 307 = 0,5686362

*Example 10.* Multiply — 36,3 = 1,5627274  
 By — 2,4 = 0,3845760  
 Product 88,5734218 &c. = 1,9473034

*Example 11.* Multiply — 21,23 = 1,3265407  
 By — 42,0 = 1,6234581  
 Product — 890,718 = 2,9499988

*Example*

## 286 The Use and Management of Decimals

**Example 12.** Multiply — ,004201 = ,7,6224581  
 By — ,00008 = ,5,9488475  
 Product ,0000003735 &c. = ,3,5723056

### Division of all Kinds of Decimals by Logarithms.

**Rule** { From the *Logarithm* of the *Dividend*,  
 Subtract the *Logarithm* of the *Divisor* ;  
 The *Remainder* is the *Logarithm* of the *Quotient*.

**Example 1.** Divide — 44,64 = 1,6497242  
 By — 12,4 = 1,0934217  
 The Quotient — 36 = 0,5563025

**Example 2.** Divide — 310 = 2,4913617  
 By — 4,275 = 0,6309361  
 Quotient — 72,51457 = 1,8604256

**Example 3.** Divide — 434,34 = 2,6378298  
 By — 762 = 2,8819550  
 Quotient — 570 = 2,7558748

**Example 4.** Divide — ,006935 = ,7,8410465  
 By — 36,5 = 1,5622929  
 Quotient — ,00019 = ,6,2787536

**Example 5.** Divide — ,000002073 = ,4,3089910  
 By — ,00021 = ,6,3222193  
 Quotient — ,0097 = ,7,2867717

**Example 6.** Divide — 176 = 2,2455126  
 By — 6, = 0,8239087  
 Quotient — 26,4 = 1,4216039

**Example 7.** Divide — 7,28 = 0,8621314  
 By — 2,8 = 0,4259687  
 Quotient — 2,73 = 0,436162

*Example 7*

*Example 8.* Divide — 30,1 = 1,4785664  
 By — 63, = 1,8037053  
 Quotient — 473 = 9,6748618

*Example 9.* Divide — 177,61236 = 2,1975902  
 By — 2,752 = 0,4398906  
 Quotient — 57,24 = 1,7576996

*Example 10.* Divide — 3,70 = 0,5686362  
 By — 6, = 2,7447275  
 Quotient — 6, = 0,8239087

*Example 11.* Divide — 200,718 = 2,2499988  
 By — 42,0 = 1,6234581  
 Quotient — 21,22 = 1,3265407

*Example 12.* Divide 0,000000243200 = 3,3861506  
 By — 0,0002172 = 6,3370052  
 Quotient 0,00111,98 = 7,0491454

*The Golden Rule in Decimals by Logarithms.*

*Example 1. Direct Proportion.*

If 2 C. 3 gr. 21 lb. of Sugar — 2,9375 = 0,4679778  
 Cost 6 l. 1 s. 8 d. — 6,083 = 0,7841316  
 What costs 12 C. 2 grs. — 12,5 = 1,0969100  
 1,8810416

Answer, 25 l. 17 s. 8½ d. — 25,8864583 = 1,4130638

*Example 2. Inverse Proportion.*

If Wheat be 6 s. 4 d. per Bushel, — 6,3 = 0,8016325  
 And the Pen. white Loaf weigh 7¼ oz. 7,75 = 0,8893017  
 What must it weigh, when } 1,6909342  
 Wheat is 3 s. 10 d. per Bushel? } — 3,83 = 0,5835766

Answer, 12 oz. 16 pwt. 2 gr. = 12,8043 Gr. = 1,1073576

*Note,*

## 288 · The Use and Management of Decimals

*Note*, Either of those Questions may (and that most conveniently) be wrought at once, viz. by *One Addition* of the two Logarithms now added, and the *Arithmetical Complement* of that *Logarithm* that is subtracted; for to *subtract* a *Logarithm*, or add its *Arithmetical Complement*, produces the same Effect, or is the same Thing.

*Example 3. Direct Proportion at one Operation.*

If 1 C. of Tobacco	—	—	5 = 0,3010299
Cost 4l. 12s. 8d.	—	—	4,63 = 0,6658935
What cost 7 Pounds?	—	—	,0625 = <u>8,7958800</u>
Answer, 00l. 11s. 7d.	—	—	,57916 = <u>9,7628034</u>

*Example 4. Inverse Proportion at one Operation.*

If 8 Rods in Width,	—	—	8 = 0,9030900
Require 20 in Length, to make an Acre;	—	—	20 = 1,3010300
What Length does 12,5 Rods in	}	12,5 = 8,9030899	12,5 = <u>8,9030899</u>
Width require for an Acre?			
Answer, 12,8 Rods	—	—	12,8 = <u>1,1072099</u>

This Method with working at once with Arithmetical Complement is to be advised to the expert *Geometrician* in his *Trigonometrical Calculations*, as much the best.

*Example 5.*

As the Sine of the Angle ABC	—	39°	15 = 0,1987985
Is to the Side given AC	—	—	12,5 = 1,0969100
So is the Sine of the Angle BAC	—	50°	45 = <u>9,8889612</u>
To the Side sought BC	—	—	15,3 = <u>1,1846697</u>

*Extraction*

*Extraction of Roots in Decimals by Logarithms.*

To extract the Root of any Number, do thus;

If it be the	}	Square Root	}	Divide the Logarithm of the	}	2
		Cube Root		given Number		3
		Biquadrate Root		by		4
		Sur-solid Root		—		5

Then the second, third, fourth, &c. Part of the Logarithm thus divided, shall be the Logarithm of the Root sought.

*Example 1.* What is the Square Root of the Number 2830,24?

The Logarithm thereof is — 3,4518232  
 Half of which, is the Logarithm of 53,2 = 1,7259116  
 The Root sought.

*Example 2.* Requir'd the Square Root of 13,2?

The Logarithm of the given Number 13,2 = 1,1205739  
 Half, is the Logar. of the Root 3,6331 &c. = 0,5602869

*Example 3.* Requir'd the Square Root of 14,8?

The Logarithm of — 14,8 = 1,1663314  
 Half, is the Logar. of the Root 3,8297 &c. = 0,5831657

*Example 4.* What is the Cube Root of 1,728?

The Logarithm of — — 1,728 = 0,2379437  
 One Third, is the Log. of the Cube Root 1,2 = 0,0791812

*Example 5.* What is the Biquadrate Root of 178,62?

The Logarithm of — 178,62 = 2,2445526  
 One 4th, is the Log. of the R. 3,64019 &c. = 0,5611381

*Example 6.* Quere the Sur-solid Root of 31,25?

The Logarithm of — — 31,25 = 1,4948500  
 One Fifth, is the Log. of the Root 1,990 &c. = 0,2989700

*Note* ; When the *Index* is *Negative*, add to it 10 for the *Square* Root, 20 for the *Cube* ; 30 for the *Biquadrate* ; 40 for the *Surfolid* Root, &c. and then divide as before ; as in the following *general Example*.

*Example 7.* What are the several Roots of ,27588 ?

The Logarithm of	—	,27588	=	,9,4407132
An Half, is the <i>Square</i> Root		,52523	&c.	= ,9,7203566
A Third, is the <i>Cube</i> Root		,6509	&c.	= ,9,8135710
A Fourth, is the <i>Biquadrate</i> Root		,7247	&c.	= ,9,8601783
A Fifth, is the <i>Surfolid</i> Root		,7729	&c.	= ,9,8881426

## C H A P. XII.

*The Use of DECIMALS in Algebra ;  
exemplified in the Resolution of thirty four  
Select, Pleasant, and Useful Algebraick  
Questions.*

**N**OTWITHSTANDING *Algebra* has the Glory and Reputation of being one of the Topmost Branches of the Tree of human Arts and Sciences ; yet must it be acknowledged that (as sublime and useful a Science as it is) it would answer no great Purpose of practical Knowledge, were not the Art of *Decimal Arithmetick*, on every Occasion, called in to its Assistance. *Vulgar Fractions* and *Algebra* together, may be view'd as the *Blind leading the Blind* ; And Whole Numbers miserably help the *lame Dog over the Stile*.

'Tis *Decimals* therefore which in all Cases ( not studied and stated on purpose, but ) which contingently or occasionally happen, can only speak out plainly and intelligibly the re-  
clude Meaning of an *Algebraick Equation* or *Theorem*.

This

This I shall make appear by the Resolution of the most curious pleasant and useful Questions, which I have selected from the best *Algebraick Authors* extant?

*Question 1.* The Sum ( $= s = 67$ ) of any two Numbers, and their *Difference* ( $= d = 30$ ) being given to find those Numbers.

Let	1	$a =$ the Greater, and $e =$ the Lesser Number.	
Then	2	$a + e = s = 67$	
And	3	$a - e = d = 30$	
$2 + 3$	4	$2a = s + d = 97$	
$4 \div 2$	5	$a = \frac{s+d}{2} = 48,5$ the greater Num.	}
$2 - 3$	6	$2e = s - d - 37$	
$6 \div 2$	7	$e = \frac{s-d}{2} = 18,5$ the lesser Number	

*Question 2.* The Sum ( $= s = 15$ ) and *Product* ( $= p = 15$ ) of any two Numbers given, to find those Numbers?

Then	1	$a + e = s = 15$	}	Quere $a$ , and $e$ .
	2	$ae = p = 15$		
$1 \odot 2$	3	$aa + 2ae + ee = ss = 225$		
$2 \times 4$	4	$4ae = 4p = 60$		
$3 - 4$	5	$aa - 2ae + ee = ss - 4p = 165$		
$5 \div 2$	6	$a - e = \sqrt{ss - 4p} = 12,845$ &c.		
$1 + 6$	7	$2a = s + \sqrt{ss - 4p} = 27,845$		
$7 \div 2$	8	$a = \frac{s + \sqrt{ss - 4p}}{2} = 13,921$ &c. Great.	}	Numb. sought.
$1 - 6 \div 2$	9	$e = \frac{s - \sqrt{ss - 4p}}{2} = 1,038$ &c. Lesser		

292 *The Use of Decimals in Algebra.*

*Question 3.* What two Numbers are those whose Sum is  $= 40 = s$ , and the Greater divided by the Lesser shall quote  $50 = q$ ?

Here	}	1	$a + e = s = 40$	}	Quere $a$ , and $e$ ?
		2	$\frac{a}{e} = q = 50$		
$2 \times e$		3	$a = qe = 50e$		
$2 - 3$		4	$e = s - qe = 40 - 50e$		
$4 + qe$		5	$qe + e = s = 40$		
$5 \div q + 1$		6	$e = \frac{s}{q+1} = \frac{40}{50+1} = 0,7842$ Sc. Lesser	}	Numb. sought.
$1 - 6$		7	$a = \frac{qs}{q+1} = 39,2156$ Sc. Greater		

*Question 4.* What two Numbers are those, whose Sum is  $= 8 = s$ , and the Sum of their Squares  $= 37\frac{1}{2} = z$ ?

Here	}	1	$a + e = s = 8$	}	Quere $a$ , and $e$ ?
		2	$aa + ee = z = 37\frac{1}{2}$		
$1 \odot 2$		3	$aa + 2ae + ee = ss = 64$		
$3 - 2$		4	$2ae = ss - z = 26\frac{1}{2}$		
$2 - 4$		5	$aa - 2ae + ee = 2z - ss = 11\frac{1}{2}$		
$5 \div 2$		6	$a - e = \sqrt{\frac{2z - ss}{2}} = 3,3$		
$1 + 6$		7	$2a = s + \sqrt{\frac{2z - ss}{2}} = 11,3$		
$7 \div 2$		8	$a = \frac{s + \sqrt{\frac{2z - ss}{2}}}{2} = 5,6$ Greater	}	Number sought.
$1 - 6 \div 2$		9	$e = \frac{s - \sqrt{\frac{2z - ss}{2}}}{2} = 2,3$ Lesser		

*Question 5.* If the Sum of any two Numbers be  $50 = s$ , and the Difference of their Squares be  $273 = x$ , What are the said Numbers?

Here	}	1	$a + e = s = 50$	}	Quere $a$ , $e$ ?
		2	$aa - ee = x = 273$		
$2 \div 1$		3	$a - e = \frac{x}{s} = 5,46$		
$1 + 3$		4	$2a = \frac{ss + x}{2s} = 55,46$		
$4 \div 2$		5	$a = \frac{ss + x}{2s} = 27,73$ the Greater	}	Number sought.
$1 - 3 \div 2$		6	$e = \frac{ss - x}{2s} = 22,27$ the Lesser		

*Question*

Question 6. Suppose the Difference of two Numbers be  $30 = d$ , and the Product  $512 = p$ . Quere those Numbers?

Here {	1	$a - e = d = 30$	}	Quere $a, e$ .	
	2	$ae = p = 512$			
	1 ⊖ 2	3	$aa - 2ae + ee = dd = 900$		
	2 × 4	4	$4ae = 4p = 9048$		
	3 + 4	5	$aa + 2ae + ee = dd + 4p = 2948$		
	5 ÷ 2	6	$a + e = \sqrt{dd + 4p} = 5929$		
	6 + 1 ÷ 2	7	$a = \frac{d + \sqrt{dd + 4p}}{2} = 42, 18$ Greater	}	Number sought.
	6 - 1 ÷ 2	8	$e = \frac{\sqrt{dd + 4p} - d}{2} = 12, 18$ Lesser		

Question 7. Suppose the Difference of two Numbers be the same with the Quotient of the Greater divided by the Lesser, viz. = 18. Quere those Numbers?

Here {	1	$a - e = d = 18$	}	Quere $a, e$ .	
	2	$\frac{a}{e} = q = 18$			
	2 × e	3	$a = qe = 18e$		
	1 + e	4	$a = d + e = 18 + e$		
	3, 4	5	$qe = d + e = 18 + e$		
	5 - e	6	$qe - e = d = 18$		
	6 ÷ q - 1	7	$e = \frac{d}{q-1} = 1, 058$ the Lesser	}	Number sought.
	1 - 7	8	$a = \frac{qd}{q-1} = 19, 058$ the Greater		

Question 8. The Difference of two Numbers = 5 = d, and the Sum of their Squares = 52 = z, being given; to find those Numbers.

Here {	1	$a - e = d = 5$	}	Quere $a, e$ .	
	2	$aa + ee = z = 55$			
	1 ⊖ 2	3	$aa - 2ae + ee = dd = 25$		
	3 - 3	4	$2ae = z - dd = 30$		
	2 + 4	5	$aa + 2ae + ee = 2z - dd = 85$		

Question 11. The Product of any two Numbers = 100 =  $p$ , and the Sum of their Squares = 1000 =  $z$ ; Quere those Numbers?

Here	{	1		$ae = p = 100$	}	Quere $a, e$ ?
		2		$aa + ee = z = 1000$		
1 X		2		$2ae = 2p = 200$		
2 +		3		$aa + 2ae + ee = z + 2p = 1200$		
4 $\sqrt{}$		4		$a + e = \sqrt{z + 2p} = 34,641$		
2 -		3		$aa - 2ae + ee = z - 2p = 800$		
6 $\sqrt{}$		2		$a - e = \sqrt{z - 2p} = 28,284$		
5 + 7 $\div$		2		$a = \frac{\sqrt{z + 2p} + \sqrt{z - 2p}}{2} = 31,462$ Gr.	}	Numb. sought.
5 - 7 $\div$		2		$e = \frac{\sqrt{z + 2p} - \sqrt{z - 2p}}{2} = 3,178$ Lef.		

Question 12. The Product of any two Numbers = 10 =  $p$ , and the Difference of their Squares = 20 =  $x$ , being given; thence to find those Numbers?

Here	{	1		$ae = p = 10$	}	Quere $a, e$ ?
		2		$aa - ee = x = 20$		
1 $\odot$		2		$aaaa = pp = 100$		
2 $\odot$		2		$aaaa - 2aaee + eeee = xx = 400$		
3 X		4		$4aaee = 4pp = 400$		
4 +		5		$aaaa + 2aaee + eeee = xx + 4pp = 800$		
6 $\sqrt{}$		2		$aa + ee = \sqrt{xx + 4pp} = 28,284$		
2 +		7		$2aa = x + \sqrt{xx + 4pp} = 48,284$		
8 $\div$		2		$aa = \frac{x + \sqrt{xx + 4pp}}{2} = 24,142$		
9 $\sqrt{}$		2		$a = \frac{\sqrt{x + \sqrt{xx + 4pp}}}{2} = 4,917$ Sc. G.	}	N.
7 - 2 $\div$		2		$e = \frac{\sqrt{xx + 4pp} - x}{2} = 2,035$ Sc. L.		

Question

296 *The Use of Decimals in Algebra.*

*Question 13.* The *Quotient* of any two Numbers = 10 =  $q$ , and the *Sum* of their *Squares* = 57 =  $z$ , being given; to find those Numbers?

Here	}	1	$\frac{a}{e} = q = 10$	}	Quer $a, e$ ?
		2	$aa + ee = z = 57$		
1 $\times$ e		3	$a = qe = 10e$		
3 $\ominus$ 2		4	$aa = qqee = 100ee$		
2 $-$ 4		5	$ee = z - qqee = z - 100ee$		
4 $+$ qqe		6	$qqee + ee = z = 57$		
6 $\div$ qq + 1		7	$ee = \frac{z}{qq + 1} = 56,43$		
2 $-$ 7		8	$aa = \frac{qqz}{qq + 1} = 56,43$		
8 $\ominus$ 2		9	$a = \sqrt{\frac{qqz}{qq + 1}} = 7,512$ &c. Great	}	Numb. fought.
7 $\ominus$ 2		10	$e = \sqrt{\frac{z}{qq + 1}} = 7,512$ &c. Lef.		

*Question 14.* Suppose the *Quotient* of two Numbers = 20 =  $q$ , and the *Difference* of their *Squares* = 100 =  $x$ ; Thence to find the Numbers.

Here	}	1	$\frac{a}{e} = q = 20$	}	Quer $a, e$ ?
		2	$aa - ee = x = 100$		
1 $\times$ e		3	$a = qe = 20e$		
3 $\ominus$ 2		4	$aa = qqee = 400ee$		
2 $+$ ee		5	$aa = x + ee = 100 + ee$		
4 $-$ 5		6	$qqee = x + ee = 100 + ee$		
6 $-$ ee		7	$qqee - ee = x = 100$		
7 $\div$ qq - 1		8	$ee = \frac{x}{qq - 1} = 2506$ &c.		
2 $+$ 8		9	$aa = \frac{qqx}{qq - 1} = 100,2506$ &c.		
9 $us$ 2		10	$a = \sqrt{\frac{qqx}{qq - 1}} = 10,012$ &c. Greater	}	Numb. fought.
8 $us$ 2		11	$e = \sqrt{\frac{x}{qq - 1}} = 0,5006$ &c. Lesser		

*Question*

Question 15. Suppose the Sum of the Squares of any two Numbers = 300 = z, and the Difference of the said Squares = 250 = x, to find the Numbers?

Here	1	$aa + ee = z = 300$	} Querè a, e ?
	2	$aa - ee = x = 250$	
1 + 2	3	$2aa = z + x = 550$	
3 ÷ 2	4	$aa = \frac{z+x}{2} = 275$	
4 √ 2	5	$a = \sqrt{\frac{z+x}{2}} = 16,583$ &c. Greater	} Number sought.
And	6	$e = \sqrt{\frac{z-x}{2}} = 5$ &c. Lesser	

Thus any two of those Six Things (viz. Sum, Difference, Prôduct, Quôtient, Sum of the Squares, and Difference of the Squares, of any two Numbers) being given; 'twill be easy to find the Numbers themselves and all the other Particulars:

I have chose to give the Analytical Procefs of the Work of each Question at large, that the Young Student may see the Manner of Investigating Theorems; and by viewing the frequent Divisions and Extractions, may the more clearly perceive the great Use, or rather, the absolute Necessity of Decimals, in order to express the Equations in Numbers.

But in those Questions which follow, I have only exhibited the Theorem or Equation which answers them; and given the Solution of each in Decimal Numbers.

Question 16. There are two Numbers a, e. The Sum of their Squares is  $aa + ee = z = 97$  The Greater is to the Less as 12 = b is to 7 = d That is  $a : e :: b : d$  Querè a, e ?

Theorem.  $e = \sqrt{\frac{zdd}{dd+bb}}$  } to be resolved.

First Multiply the Sum of the Squares z = 97	—	$zdd = 4763$	
By the Square of d	—	$dd = 49$	
The Product is	—	$zdd = 4763$	Dividend.
Then to the Square of d	—	$dd = 49$	
Add the Square of b	—	$+bb = 144$	
The Sum of both is	—	$dd + bb = 193$	Divisor.
		Q 9	By

298 *The Use of Decimals in Algebra.*

By which Divide  $zdd$ , }  
 The Quotient will be }  $\frac{zdd}{dd + bb} = 24,679 \text{ \&c.}$

The Square Root of which is  $\sqrt{\frac{zdd}{dd + bb}} = e = 4,966$

Then as  $\left\{ \begin{array}{l} d : e :: b : a \\ 7 : 4,966 :: 12 : 8,513 \end{array} \right\}$  Thus  $\left\{ \begin{array}{l} a = 8,513 \text{ \&c.} \\ e = 4,966 \text{ \&c.} \end{array} \right.$

*Question 17.* There are three Numbers in continued Proportion, viz. — — —  $a. m. e.$

The Sum of the Extreams —  $a + e = 37\frac{2}{5} = s$

And the Mean —  $m = 13.$  Quere  $a, e$

*Theorem.*  $a = \frac{s + \sqrt{ss - 4mm}}{2}$  } to be solved.

First, The Square of the Sum is —  $ss = 1398,76$   
 And the Square of  $m \times 4$  is —  $4mm = 676$

Which subtracted, there remains,  $ss - 4mm = 722,76$

The Square Root whereof is  $\sqrt{ss - 4mm} = 26,885$

To which add the Sum of the Extreams  $s = 37,4$

That Sum is —  $s + \sqrt{ss - 4mm} = 64,285$

The half of that is the First Number  $a = 32,142$

Then as  $\left\{ \begin{array}{l} a : m :: m : e \\ 32,142 : 13 :: 13 : e \end{array} \right\}$   $e = 5,257$

The Sum of which is the Proof  $a + e = 37,4$

*Question 18.* There are three Numbers in continued Proportion, viz. — — —  $a : m :: m : e$

Their Sum is —  $a + m + e = s = 31\frac{2}{7}$  } Quere  $a, m, e$

And the Sum of their Sq.  $aa + mm + ee = z = 763$

*Theorem.*  $m = \frac{ss - z}{-2s}$  } to be solved.

First,

First, from the Square of their Sum  $ss = 978,7955$  Gr.  
 Subtract the Sum of their Squares  $x = 763$

The Remainder is  $ss - x = 215,7955$   
 Which divided by twice the Sum  $2s = 62,571428$   
 Gives the Quotient  $m = 3,446$  Gr.

Then  $31,285714 - 3,446 = 27,839 = a + e$   
 Which may be found as in the Theorem of the last Question.

Question 19. Suppose three Numbers  $a, b, c$  in Musical Proportion, viz. As  $a : c :: a - b : b - c$ , and any Two of them being given, to find the Third.

Theorem 1.  $a = \frac{cb}{2c - b}$  Finds  $a$ , if  $b, c$ , be given.

Theorem 2.  $b = \frac{2ac}{c + a}$  Finds  $b$ , if  $a, c$ , be given.

Theorem 3.  $c = \frac{ba}{2a - b}$  Finds  $c$ , if  $a, b$ , be given.

Suppose  $b = 13$ , and  $c = 10$  To find  $a$ ?

Multiply  $—$   $b = 13$

By  $—$   $c = 10$

The Product  $—$   $cb = 130$

Divide by twice  $c$ , less  $b$ ,  $2c - b = 7$   $130 = cb (18,571428$

The Quotient is  $a = 18,571428$  the Number sought. And so for either of the other.

Question 20. Suppose four Numbers,  $a, b, c, d$ , in Musical Proportion, viz.  $a : d :: a - b : c - d$ ; and any Three of these given, to find the fourth.

Theorem 1.  $a = \frac{db}{2d - c}$  Finds  $a$ , if  $b, c, d$ , be given.

Theorem 2.  $b = \frac{2da - ca}{d}$ , Finds  $b$ , if  $a, d, c$ , be given.

Theorem 3.  $c = \frac{2da - db}{a}$ , Finds  $c$ , if  $a, b, d$ , be given.

Theorem 4.  $d = \frac{ca}{2a - b}$ , Finds  $d$ , if  $a, b, c$ , be given.

## 300 The Use of Decimals in Algebra.

**Question 21.** Suppose it was required to divide any Number ( $20 = s$ ) into *Extream* and *Mean Proportion*; That is, into two such Parts,  $a$ , and  $e$ , that  $aa = ae + ee = se$ .  
 Quere  $a$ ,  $e$ ?

*Theorem.*  $a = \sqrt{ss + \frac{1}{4}ss} - \frac{1}{2}s$

Square the given Number —  $ss = 400$

Add thereto  $\frac{1}{4}$  of the said Square —  $\frac{1}{4}ss = 100$

The Sum is —  $ss + \frac{1}{4}ss = 500$

The Square Root thereof is —  $\sqrt{ss + \frac{1}{4}ss} = 22,3606 \text{ Sc.}$

From which subtract  $\frac{1}{2}$  the given Num.  $\frac{1}{2}s = 10$

There Remains the *Greater Part* —  $a = 12,3606 \text{ Sc.}$

Which subtracted from the given Num. }  $e = 7,6393 \text{ Sc.}$

There remains the *Lesser Part*

*Note.* 'Tis impossible to answer this Question in *Whole Numbers*.

**Question 22.** What is the *Canon* or *Theorem* for *Extracting* the *square Root*?

Suppose  $a + e = \text{Root}$ ; Then the *Canon* is this, *viz.*  
 $aa + 2ae + ee = \text{Square}$ .

Extract the Sq. Root of  $655,36 = aa + 2ae + ee$

From the Num. subtr.  $400 = aa$  ( $a = 20$ )

There Remains —  $255,36 = 2ae + ee$  {  $a = 20$   
 $e = 5$

Divide that by  $2a = 40$  )  $255,36$  ( $5 = e$  {  $a + e = 25$

Then subtract —  $225 = 2ae + ee$  {  $= a, \text{ anew.}$

There Remains —  $30,36 = 2ae + ee$  anew.

Which divid by  $2a = 50$ )  $30,36$  ( $6 = e$  anew {  $25 = a$

Then again subtract  $30,36 = 2ae + ee$  {  $,6 = e$

... }  $25,6 = a + e$

**Question 23.** What is the *Canon* or *Theorem* for extracting the *Cube Root*?

Suppose  $a + e = \text{Root}$ , Then  $aaa + 3aae + 3aee + eee$   
 is the *Canon* or Rule for Extracting any *Cube Root*.

Requir'd

Requir'd the *C. Root* of  $1953,125 = aaa + 3aae + 3aee + eee$   
 Subtract the Cube  $\underline{1000} = aaa$  ( $a=10$ . *ist.*)

There remains  $— 953,125 = 3aae + 3aee + eee$

Div. by  $3aa + 3a = 330$   $\underline{953,125(2=e)}$

Then  $— 600 = 3aae$

And  $— 120 = 3aee$

Lastly  $— 8 = eee$

The Sum of all is  $\underline{728} = \left\{ \begin{array}{l} 3aae + 3aee + eee \text{ subst.} \\ \text{from the Remainder.} \end{array} \right.$

There remains  $— 225,125 = 3aae + 3aee + eee$ , anew.

Div. by  $3aa + 3a = 468$   $\underline{225,125(,5=e)}$   $\left\{ \begin{array}{l} \text{Then } a = 10 \\ e = 2 \\ a + e = 12 \\ = a, \text{ anew.} \end{array} \right.$

Then  $— 216,000 = 3aae$

And  $— 9,000 = 3aee$

Lastly  $— 0,125 = eee$

The Sum of all is  $\underline{225,125} = 3aae + 3aee + eee$  to be  
 ..... (subst. from the last Rem.)

Hence the Root is  $10 + 2 + ,5 = 12,5$

*Note*, From hence appears the *Rationale* of the Method of *extracting the Cube Root*; for the Precepts there are only the Words expressing the order and *combination* of the *Symbols* of this *Canon*.

*Question 24.* What is the Manner of *Extraction* by *Converging Series*, or Theorems raised thereby?

There are several Kinds of *Converging Series* for this Purpose, but Mr. *Ward's* I take to be the best, which is thus.

Let  $aa = G$ . Quere  $a$ ?

Let	1	$r + e = a$	The Root sought.
⊖ 2	2	$rr + 2re + ee = aa = G$ .	
— r	3	$2re + ee = G - rr = D$	The Dividend.
Then	4	$\frac{D}{2r + e} = e$ , or, $\frac{D}{r + \frac{1}{2}e} = e$	Theorems for the Sq. Root.

Let

Let  $aaa = G$ . Quere  $a$ .

Put	1	$r + e = a$	The Root sought
1 $\ominus$ 3	2	$rrr + 3rre + 3ree + eee = aaa = G$	
2 $-$ rrr	3	$3rre + 3ree + eee = G - rrr$	
3 $\div$ 3r	4	$re + ee + \frac{eee}{3r} = \frac{G - rrr}{3} = D$ , the Dividend.	
Reject $\frac{eee}{3r}$	5	$re + ee = D \frac{eee}{3r}$ being of small or no Value.	
5 $\div$	6	$\frac{D}{r + e} = e$ . The Theorem for the Cube.	

If  $aaaa = G$  Then  $\frac{G - r^4}{2rr} = D$  and  $\frac{D}{2r + 3e} = e$   
 The Theorem for the Biquadrate Root.

If  $aaaaa = G$ . Then  $\frac{G - r^5}{5r^3} = D$ . And  $\frac{D}{r + 2e}$   
 The Theorem for the Surfolid Root.

And in the same Manner proceed for any other Root.

*Note* ; To work by these Theorems,  $r$  must be taken less than the Root ; otherwise, if  $r$  be taken greater than the true Root, it will be  $rr - G$  instead of  $G - rr$ , and  $\frac{D}{2r - e} = e$  and the same in other Theorems for the other Roots.

After the same Manner you raise Theorems for all kind of adfected Equations.

Suppose  $aaa + 24a = 587914$  Quere  $a$ ?

Put	1	$r + e = a$	Put $r = 80$	} The powers of $e$ above $ee$ are all to be rejected.
1 $\ominus$ 3	2	$rrr + 3rre + 3ree = aaa$		
1 $\times$ 24	3	$24r + 24e = 24a$		
2 in Numb.	4	$512000 + 19200e + 240ee = aaa$		
3 in Numb.	5	$1920 + 24e = 24a$		
4 + 5	6	$513920 + 19224e + 240ee = 587914$		
5 $-$ 513920	7	$19224e + 240ee = 73994$		
7 $\div$ 240	8	$80,1e + ee = 308,31 = D$ the Dividend		
8 $\div$	9	$e = \frac{D}{80,1 + e}$	See the Operation.	

$$\begin{array}{r}
 80,1) 308,31 = D(3,7 = e \\
 + e = 3 \quad 2493 \\
 \hline
 1 \text{ Divisor } 83,1) 59,01 \\
 + e = ,7 \quad 5866 \\
 \hline
 2 \text{ Divisor } 83,8) \quad \cdot 35
 \end{array}
 \left. \begin{array}{l}
 r = 80 \\
 e = 37 \\
 r + e = 83,7 = a
 \end{array} \right\}$$

Here 83,7 is a new  $r$  for a *second Operation*; but being involved will be found too big, or *greater* than the *true Root*; Therefore it must be made  $r - e = a$  the Root.

Thus	1	$r - e = a$ the Root sought.
1 $\odot$ 3	2	$rrr - 3re + 3ee = aaa$
1 $\times$ 24	3	$24r - 24e = 24a$
2 in Numb.	4	$586376,253 - 21017,07e + 251,1ee = aaa$
3 in Numb.	5	$2008,8 - 24e = 24a$
4 + 5	6	$588385,053 - 21041,07e + 251,1ee = 587$
6 - 587914	7	$21041,07e - 251,1ee = 471,053 \quad (914$
7 $\div$ 251,1	8	$83,7955e - ee = 1,87595778 = D$
8 $\div$	9	$e = \frac{D}{83,7955 - e}$

Operation 2.

$$\begin{array}{r}
 83,7955) 1,87595778(,022392736 \\
 - e = 02 \quad 1,675510
 \end{array}$$

$$\begin{array}{r}
 1 \text{ Divisor } 83,7755) ,2001477 \\
 - e = ,002 \quad 1675470 \\
 \hline
 2 \text{ Divisor } 83,7735) ,03290078 \\
 - e = ,0003 \quad ,02513196 \\
 \hline
 3 \text{ Divisor } 83,7732) ,00776882 \\
 \quad \quad \quad 753958
 \end{array}$$

From hence 'tis sufficient to work by Contracted Division to find the Remainder of the Root.

$$\begin{array}{r}
 \text{Now } r = 83,7 \\
 \text{And } e = 0,022392736
 \end{array}$$

$$\begin{array}{r}
 \text{Then } r - e = 83,677607264 = a \\
 \text{The Root of } 587914 \text{ requir'd}
 \end{array}$$

4 &c.

And

Then, if  $A$  moves first, }  $x = \frac{cdh + ce}{fd + gc}$  4.  
 the *Theorem* is —

But if  $B$  moves first, }  $x = \frac{cdh + ce}{fd + gc}$  5.  
 the *Theorem* is —

If they both move at the }  $x = \frac{ce}{fd + gc}$  6.  
 same time, the *Theorem* }  
 is — —

These Six *Theorems* answer most of the curious (and some of them very useful) Questions that are usually proposed concerning the *Motion* of two Bodies.

*Question 26.* Suppose the *Sun* ( $A$ ) in the Beginning of *Virgo*, and eight Days after the *Moon* ( $B$ ) is in the Beginning of *Gemini*; Quere the Place of the next *New Moon*?

Here are given  $\left\{ \begin{array}{l} c = 0,03285 = \overset{\circ}{0} : \overset{\prime}{59} : \overset{\prime\prime}{08} \\ f = 1, \\ d = 0,4892 = \overset{\circ}{13} : \overset{\prime}{10} : \overset{\prime\prime}{35} \\ g = 1, \\ e = 3, \\ b = 8, \end{array} \right\} \text{ Quere } x?$

By *Theorem 1*, work as follows;

Multiply —  $d = 0,4892$   $\text{J's given Motion.}$   
 By —  $c = 0,03285$   $\text{O's given Motion.}$

The Product is  $dc = 0,01607$   
 Which mult. by  $b = 8$  Difference of Time.

That Prod. is  $dc b = 0,12856$   
 Again multiply  $d = 0,4892$   $\text{J's given Motion,}$   
 By —  $fe = 3$  Difference of Place mul.  
 (multiplied into  $f$ .)

The Prod. is  $fed = 1,4676$   
 To which add  $dc b = 0,12856$   
 Sum is  $bdc + fed = 1,59616$  The Dividend.

Then from —  $fd = 0,4892$   
 Subtract —  $gc = 0,03285$   
 Remains  $fd - gc = 0,45635$  The Divisor.

306 *The Use of Decimals in Algebra.*

By which divide, }  $x = 3,49769 = 3 : 14 : 55 : 05$  Signs 0 . "  
 The Quotient is }  
 To which add the *Moon's* pref. Fl. = 2 : 00 : 00 : 00  
 The Sum is the Place of the }  
 Next New Moon sought } *viz.* In ~~the~~ } 14 : 55 : 05

*Question 27.* If a Ship *B* fail from the *Equator* precisely *North*, at the Rate of  $7\frac{1}{2}$  Degrees in 3 Days, and another Ship *A*, 8 Days after set fail on the same Meridian the same Way, in

*Latitude*  $36^{\circ} : 30'$ , and runs  $8^{\circ} : 45'$  in five Days; 'tis required to tell in what Degree of North Latitude *B* will overtake *A*?

By *Theorem 2.* Thus;

Multiply the given Motion of <i>A</i>	—	$c = 8,75$
By the given Motion of <i>B</i>	—	$d = 7,5$
The Product is	—	$dc = 65,625$
Multiply that by the Interval of Time	—	$b = 8$
The Product is the Subtrahend	—	$bdc = 525,000$
Then multiply the given Interval of Places	—	$e = 36,5$
By the given Motion of <i>B</i>	—	$d = 7,5$
The Product is	—	$ed = 273,75$
Which multiplied by <i>A's</i> given Time	—	$f = 5$
The Product is	—	$fed = 1368,75$
From which subtract the Subtrahend	—	$bdc = 525,00$
Remains the Dividend	—	$fed - bdc = 843,75$
Then from $7,5 \times 5$	—	$fd = 37,5$
Subtract $8,75 \times 3$	—	$gc = 26,25$
There remains the Divisor	—	$fd - gc = 11,25$
By which Divide; the Quotient is = $x$ ,	} $x = 75^{\text{th}}$ Deg.	
the Latitude sought, <i>viz.</i>		

*Question 28.* *A* challenges *B* to run a Race with him, provided he will give him 30 Rod in a 100; now the Velocity of *B's* Running to that of *A*, is as  $7\frac{1}{2}$  to  $5\frac{1}{2}$ . *Query* which of the two beat?

By

By *Theorem 3*, work thus ;

$$\begin{array}{r} \text{Multiply the Velocity of } B \quad \text{---} \quad d = 7,75 \\ \text{By the given Interval of Distance} \quad \text{---} \quad e = \underline{30} \\ \text{The Product (because } f = 1) \text{ is the Dividend } fd = \underline{232,5} \end{array}$$

$$\begin{array}{r} \text{Then from} \quad \text{---} \quad fd = 7,75 \\ \text{Subtract} \quad \text{---} \quad gc = 5,5 \\ \text{There Remains the Divisor} \quad fd - gc = \underline{2,25} \end{array}$$

$$\text{Then} \quad \text{---} \quad 2,25) 232,5 \quad (103 = x = 103,3 \text{ Rods.}$$

Hence *A* beat *B*, since above the 100 Rods were pass'd ere *B* came up with, or could overtake him.

*Question 29.* Suppose the *Hour* and *Minute Hand* of a *Horologium*, or *Clock*, be now both in *Conjunction* at 12, *Quere* the Place of their next *Conjunction* ?

If you proceed by the same *Theorem 3*, you will find it to

be at 1 : 59 Hours = 1 : 5 : 27 : 10 : 21 : 49, &c. the last five Places repeating *ad infinitum*. Hence we may observe, that though there really is a certain *Moment of Time* in which the *Minute-Hand* is precisely in *Conjunction* with the *Hour-Hand*, yet 'tis impossible to determine or represent that *Moment of Time* either in *whole Numbers*, or *Decimal Fractions*; But by *Vulgar Fractions* we know it is 11 : Hours, that is just *one Eleventh Part* of an *Hour* after *one a Clock*.

*Question 30.* From *London* to *Chichester* is 60 Miles; A *Post-Boy (A)* sets out from *London*, and goes 8 $\frac{1}{4}$  Miles in 2 $\frac{1}{2}$  Hours; Another *Post-Boy (B)* 1 $\frac{1}{2}$  Hour after sets out from *Chichester*, and rides 9 Miles in 3 $\frac{1}{4}$  Hours. I demand how far *A* will have gone before he meets *B*?

This *Question* is answered by *Theorem 4*, thus;

$$\begin{array}{r} \text{Multiply } A\text{'s given Space} \quad \text{---} \quad c = 8,75 \\ \text{By the Interval of the Times} \quad \text{---} \quad b = \underline{1,5} \\ \text{Then multiply that Product} \quad \text{---} \quad cb = 13,125 \\ \text{By the given Space of } B \quad \text{---} \quad d = \underline{9} \\ \text{The Product is} \quad \text{---} \quad cdb = 118,125 \\ \text{R r 2} \quad \text{Again} \end{array}$$

308 *The Use of Decimals in Algebra.*

Again multiply	—	—	$e =$	8,75
By the given Time of B	—	—	$g =$	3,25
And that Product	—	—	$eg =$	28,4375
Mult. by the Interv. of Distance	—	—	$e =$	60
To that Product	—	—	$eg^2 =$	1706,25
Add that above, viz.	—	—	$cdh =$	118,125
The Sum is the Dividend	—	—	$cdh + ege =$	1824,375
Then to the Product above,	—	—	$eg =$	28,4375
Add the Prod. of ( $f \times d = 2,5 \times 9$ )	—	—	$fd =$	22,5
The Sum is the Divisor	—	—	$fd + eg =$	50,9375
By which dividing; the Quotient is the Dist. of A's Journey	—	—	$x =$	36,208
Then the Distance B will have pass'd is	—	—	$=$	23,791

} Anf.

And thus proceed for answering Questions by *Theorems* the fifth and sixth. By these *Theorems* several other pretty *Problems* proposed, may be resolv'd by any one versed in those Matters.

*Question 31.* This present Year of our Lord, the Cycle of the Sun is  $6 = e$ , and the Cycle of the Moon (call'd the Prime or Golden Number) is  $5 = d$ ; Quere the Year of the Dionysian Era or Period?

Here is given  $\left\{ \begin{array}{l} e = 6 \\ d = 5 \\ e - d = x = 1 \end{array} \right. \left. \begin{array}{l} \text{Let } x \text{ be the} \\ \text{Year of the Pe-} \\ \text{riod sought.} \end{array} \right.$

The *Theorem* is  $59, x z + 3, x d - 2, x e = x$ .

For, multiply the Difference of the Cycles  $x = 1$   
By the Number — — — — — 59, x

Then that Product is — — — — — = 59, x

To which add  $d \times 3, x$  — — — — — = 15, 5

From that Sum — — — — — = 74, 6

Subtract  $e \times 2, x$  — — — — — = 12, 6

There remains the Year of the Period = 62 sought.

This

This *Theorem* I contrived my self; and inserted it here as being a *Decimal* one.

*Question 32.* Let *A*, and *B*, be two *spherical Bodies perfectly elastick*; and let (*a*) denote the *Velocity* of *A*, and (*b*) = the *Velocity* of *B*; then the *Motion* of *A* = *aA*, and the *Motion* of *B* = *bB*; lastly let *x* = the *Increase* of *Motion* communicated by the *Impact* or *Stroke*, to one *Body*; and the *Decrease* or *Loss* of *Motion* in the *percutient* or *striking* *Body*.

Let *A* follow *B*, and let it be required to determine the *Celerity* of each *Body* after the *Stroke* or *Impulse*.

If *A* and *B* tend both the same Way, the *Theorem* for

$$\left\{ \begin{array}{l} A's \text{ Celerity is } x = \frac{aA - aB + 2bB}{A + B} \\ B's \text{ Celerity is } x = \frac{2aA - bA + bB}{A + B} \end{array} \right.$$

But if they meet, the *Theorems* will be altered thus, for

$$\left\{ \begin{array}{l} A, \quad x = \frac{aA - aB - 2bB}{A + B} \\ B, \quad x = \frac{2aA + bA - bB}{A + B} \end{array} \right.$$

*Example.* Suppose two *Bodies* of the same sort, *A* of 5½ Pounds, and 9 Degrees of *Velocity*; and *B* of 6½ Pounds, and 4 Degrees of *Velocity*; tend the same Way; Quere their *Celerities* after the *Impulse*?

Here *A* = 5,5. *a* = 9. *B* = 6,5. *b* = 4. Then,

From the <i>Motion</i> of <i>A</i>	—	—	<i>aA</i> =	48
Subtra& the <i>Velocity</i> of <i>A</i> into <i>B</i>	—		<i>aB</i> =	58,5
There remains <i>negative</i> ,	—		<i>aA</i> - <i>aB</i> =	- 10,5
To which add twice the <i>Motion</i> of <i>B</i>	—		<i>2bB</i> =	+ 52
There Remains the <i>Dividend</i>	—		=	+ 41,5
Then <i>A</i> + <i>B</i> = 11,8				(3,49 = <i>A</i> 's Celerity.
In like Manner may be found				8,46 = <i>B</i> 's Celerity.

*Note*; If either *Celerity* come out *Negative*, it signifies the *Motion* of that *Body*, after the *Impulse*, to be *contrary* to what it was before.

I have

### 310 *The Use of Decimals in Algebra.*

I have inserted this Question and *Theorem*, for the Sake of any such Persons as would wish to have always a *Theorem* by them for the ready determining the *Celerity* of *Bodies* in *Motion* by *Calculations*, and the rather because this *Doctrine* of *Motion* is the principal *Basis* of a good Part of the *modern* *mechanical Philosophy*.

*Question 33.* Says *A*, I've an *Acre* of *Land* to inclose; says *B*, I've ten *Thousand* such *Acres* as those, which lie in a *Square*; but the *Form* you design must have the *same Fencing* as goes round all mine. *Quere* the *Length* and *Breadth* of *A's* *Acre* of *Land*?

Let  $\begin{cases} a = 1 = \text{The Area of } A\text{'s Plot of Land.} \\ d = 100 = \text{The Side of } B\text{'s square Plot.} \\ x = \text{The Side of } A\text{'s Plot to be found.} \end{cases}$

The *Theorem* is  $x = \sqrt{dd - a} + d$ .

From the *Square* of  $d$   $dd = 10000$

Subtract the given *Area*  $- a = \underline{\quad 1}$

There remains  $- dd - a = 9999$

The *Sq. Root* thereof is  $\sqrt{dd - a} = 99,995$

To which add  $- \quad \quad \quad d = 100$

The *Sum* is one *Side* of the *Area*  $x = 199,995 =$  the *Length*,

And the other *Side* is  $- \frac{a}{x} = 0,005 =$  the *Breadth*.

Thus *twice* their *Sum* is  $= 4b = 400$  the *Perimeter* of *Both*.

*Question 34.* Suppose the *Tower A* 160 Feet high, and another *Tower B* 124 Feet high, at the *Distance A B* = 150 Feet; 'tis required to set a *Ladder* in some *Point (e)* in the *Line A*, of such a *length*, as from thence it may reach the *Tops* of both the *Towers*: *Quere* the *Point e*, and the *length* of such a *Ladder*?

Let

Let  $\left\{ \begin{array}{l} a=160 \text{ the Tower } A \\ b=124 \text{ the Tower } B \\ c=150 \text{ the Distance } BA \\ e = \text{ the Point's Dist.} \\ b = \text{ the Ladder fought.} \end{array} \right.$

The Theorem for the Distance ( $e$ )  $\frac{bb + cc - aa}{2c} = e$

Then for the Length of the Ladder ( $b$ )  $\sqrt{aa + ce} = b$

Thus, to the Square of B's height —  $bb = 15376$   
 Add the Square of the Distance —  $cc = 22500$

Then from that Sum —  $bb + cc = 37876$   
 Subtract the Square of A's height —  $aa = 25600$

There remains the Dividend  $bb + cc - aa = 12276$

Which divided by  $2c = 300$ , the }  $e = 40,92$   
 Quotient is the Distance ( $e$ ) —

Then the Length of the Ladder is  $\sqrt{aa + ce} = b = 165,149$   
 &c.

## C H A P. XIII.

*The Use of DECIMALS in Plain Trigonometry, and other Mathematical Sciences depending thereon.*

**T**HE excellent Use and indispenfable Necessity of this noble Art in all Trigonometrical Calculations, is evident enough to those who are verfed therein. Nothing with any *Exactness, Ease, or Expedition* can be done therein without it; and as *Trigonometry* is the Foundation (yea the very Essence) of *Navigation, Fortification, Altimetry, Longimetry*, and is of Use also in divers Cafes of *Astronomy, Surveying, Dialling, &c.* 'tis manifest the Use and Knowledge of *Decimal Arithmetick* is so requisite in all those Arts and Sciences, that without its Assistance a Person can make but a gloomy and fruitless Progress in the Study of them.

I shall therefore illustrate the Use of *Decimals* in the Resolution of all the Cafes of *Right-lined Trigonometry* (for that only is to be understood in this Chapter) both in the Doctrine of *Right-angled, and Oblique-angled Triangles*, as follows.

*Right-angled Triangles.*

Case 1.  
 Given  $\left\{ \begin{array}{l} \text{The two Angles} \\ B \text{ and } C, \\ \text{The Base } B A, \end{array} \right.$   
 To find the *Cathetus* and  
*Hypothenufe,*

The *Analogy* to find the *Cathetus*.

As the *Sine* of the Angle C  $56^{\circ} 15'$  Com. Arith.  $9,0801536$   
 Is to the *Base* B A  $24,5$  — — — — —  $= 1,3863818$

So is the *Sine* of the Angle  $33^{\circ} 45'$  — — — — —  $= 9,7447390$

To the *Cathetus* or *Perpendicular*  $16,26$  — — — — —  $= 1,2112744$   
 Case

Case 2. The Analogy to find the Hypotenuse.

As the Sine of the Angle  $C 56^{\circ} : 15'$  Com. Arith. 0,0801536  
Is to the Base  $BA 24,3$  — — = 1,3863818

So is Radius  $90^{\circ}$  — — = 10,0000000

To the Hypotenuse  $BC 29:27$  — — = 1,4665354

Case 3.

Given { The two Angles  $B$   
and  $C$ ,  
And the Hypotenuse  
 $BC$  ;  
To find the Base and Cathetus.

The Analogy for finding the Base.

As Radius  $90^{\circ}$  — — = 10,0000000  
Is to the Hypotenuse  $BC 27:82$  — — = 1,4398906

So is the Sine of the Angle  $C 56^{\circ} : 15'$  — — = 9,9198464

To the Base  $BA, 22:89$  — — = 1,3597370

Case 4. The Analogy to find the Cathetus.

As the Radius  $90^{\circ}$  — — = 10,0000000  
Is to the Hypotenuse  $BC 27:82$  — — = 1,4398906

So is the Sine of the Angle  $B 33^{\circ} : 45'$  — — = 9,7447390

To the Cathetus, or  $AC 15:29$  — — = 1,1846296

Case 5.

Given { The Base  $BA$ ,  
The Cathetus  $AC$  ;  
To find the Angles, and the  
Hypotenuse.

The *Analogy* to find the *Angle B*.

$$\text{As the Base } B A \text{ } 27:5 \quad \text{---} \quad \text{---} \quad = \quad 1,4393327$$

$$\text{Is to the Radius } 90 \quad \text{---} \quad \text{---} \quad = \quad 10,0000000$$

$$\text{So is the Perpendicular } 13:87 \quad \text{---} \quad \text{---} \quad = \quad 1,1420765$$

$$\text{To the Tangent of the Angle } B \text{ } 26 : 46 \quad \text{---} \quad \text{---} \quad = \quad 9,7027438$$

Then the *Angle C* is  $63 : 14$ .

*Case 6.* The *Analogy* to find the *Hypotenuse*.

$$\text{As the Tangent of the Angle } B \text{ } 26 : 46 \quad C. A. \text{ } 0,2972562$$

$$\text{Is to the Cathetus } A C \text{ } 13:87 \quad \text{---} \quad \text{---} \quad = \quad 1,1420765$$

$$\text{So is the Secant of the same Angle } B \quad \text{---} \quad \text{---} \quad = \quad 10,0492225$$

$$\text{To the Hypotenuse } 30:8 \quad \text{---} \quad \text{---} \quad = \quad 1,4885552$$

*Note.* The *Secant* of any *Angle* is the *Arithmetical Complement* of the *Co-sine* of the said *Angle*, added to *Radius* 10,0000000.

*Case 7.*

Given  $\left\{ \begin{array}{l} \text{The Base } B A, \\ \text{The Hypotenuse } B C; \end{array} \right.$   
To find the *Angles*, and the *Cathetus* *A C*,  
The *Analogy* for the *Angle C*.

$$\text{As the Hypotenuse } B C \text{ } 26 \quad \text{---} \quad \text{---} \quad = \quad 1,4259687$$

$$\text{Is to Radius } 90 \quad \text{---} \quad \text{---} \quad = \quad 10,0000000$$

$$\text{So is the Base } B A \text{ } 22:8 \quad \text{---} \quad \text{---} \quad = \quad 1,3579348$$

$$\text{To the Sine of the Angle } C \text{ } 58:45 \quad \text{---} \quad \text{---} \quad = \quad 9,9319661$$

Wherefore the *Angle B* is  $31:15$ .

*Case 8.* The *Analogy* to find the *Cathetus*.

$$\text{As Radius } 90 \quad \text{---} \quad \text{---} \quad = \quad 10,0000000$$

$$\text{Is to the Hypotenuse } 26 \quad \text{---} \quad \text{---} \quad = \quad 1,4259687$$

$$\text{So is the Sine of the Angle } B \text{ } 31:15 \quad \text{---} \quad \text{---} \quad = \quad 9,7149776$$

$$\text{To the Cathetus } A C \text{ } 13:83 \quad \text{---} \quad \text{---} \quad = \quad 1,1409463$$

*Case*

*Case 9.*

Given { The Hypotenuse *BC*  
 The Cathetus *AC*,  
 To find the Angles, and the Base  
*BA*.

The Analogy to find the Angle *C*.

As the Cathetus *AC* 166:5 — Arith. Com. 7,7788467  
 Is to the Radius  $90^\circ$  — — 10,0000000  
 So is the Hypotenuse *BC*, 316:2 = 2,5000369  
 To the Secant of the Angle *C*,  $58:15'$  10,2788836  
 Then the other Angle *B* will be  $31:45'$

*Case 10.* The Analogy for finding the Base.

As the Radius  $90^\circ$  — — — 10,0000000  
 Is to the Cathetus 166:5 — — = 2,2211533  
 So is the Tangent of the Angle *C*  $58:15'$  = 10,2084365  
 To the Base *BA* 268:927 — = 2,4295898

*Oblique-angled Triangles.*

*Case 1.*

Given { The Angles  
*A, B,* and  
*C,*  
 The Side *A*  
*C,*  
 To find the other  
 two Sides.

The Use of Decimals

The Analogy for the Side B C.

As the Sine of the Angle B  $37^{\circ}30'$  Arith. Com. 0,2155529  
 Is to the Side A C 350 — = 2,5440680

So is the Sine of the Angle A  $62^{\circ}30'$  — = 9,9479289  
 To the Side B C 509:97 — = 2,7075498

The Analogy for the Side A B.

As the Sine of the Angle B  $37^{\circ}30'$  Arith. Com. 0,2155529  
 Is to the Side A C 350 — = 2,5440680

So is the Sine of the Angle C  $80^{\circ}00'$  = 9,9933515  
 To the Side A B 566:2 — = 2,7529724

Case 2.

Given { Two Sides  
 A C and  
 A B,  
 And an Angle  
 opposite B,

To find the other B  
 Side and Angles.

The Analogy for the Angle C.

As the Side A C 340 — Arith. Comp. 7,4685211

Is to the Sine of the Angle B  $60^{\circ}00'$  — = 9,9375306  
 So is the Side B A 212:3 — = 2,3265407

To the Sine of the Angle C  $32^{\circ}42'$  — = 9,7325924  
 Then the Angle A must be 87:18 therefore,

The Analogy for the Side B C.

As the Sine of the Angle C  $32^{\circ}42'$  Com. Arith. 0,2674076  
 Is to the Side B A 212:3 — = 2,3265407

So is the Sine of the Angle A  $87^{\circ}18'$  — = 9,9995176

To the Side B C 39:21 — = 2,5934659  
 Case

Case 3.

Given { Two Sides AC  
and AB,  
And the Angle  
included A,  
To find the other Side  
and Angles.

The *Analogy* for the *Angles*.

As the *Sum* of the two Sides 661:2 *Com. A.* = 7,1796672  
Is to the *Difference* of the Sides 180:4 = 2,2562365  
So is *Tangent* of  $\frac{1}{2}$  *Sum* of the unknown

Angles B and C 76:27 — } = 10,6179795

To the *Tangent* of  $\frac{1}{2}$  *their Difference* 48:32 = 10,0538832

Then, To half the *Sum* — 76:27 of two Ang. B, C.  
Add half the *Difference* 48:32

The *Sum* is — 124:59 = Greater Ang. B.  
Subtract the  $\frac{1}{2}$  *Differ.* Remains 27:55 = Lesser Ang. C.

The *Analogy* for the *Side BC*.

As the *Sine* of the Angle C 27:55 *Arith Com.* 0,3295808

Is to the *Sine* of the Angle A 27:05 = 9,6582842

So is the *Side AB* 240,4 = 2,3809345

To the *Side BC* 23,37 — — = 2,3687995

Case 4.

Given { All the three  
Sides, AB,  
A C, and  
CB,  
To find the *Angles*.

The

The Analogy for the Segments  $Ad$ , and  $dB$ .

As the Greater Side or Base  $AB$  373:4 *Ar. Com.* 7,4278258

Is to the Sum of the other two Sides } = 2,6582023

$AC + CB = 455:2$  — } = 2,0941216

So is the Difference of the two Sides } = 2,0941216

$AC - CB = 124:2$  — } = 2,0941216

To the Difference of the Segments of the } = 2,1801497

Base  $Ae = 151:4$  — } = 2,1801497

Then from the *Grea. Side* or Base = 373:4

Subt. the *Diff.* of the Segments  $Ae = 151:4$

There will remain  $eB$  — = 222

The half of which is  $Bd = ed = 111$  the Lesser Segm.

Also to  $Ae$  add  $ed$ , the Sum is  $Ad = 262:4$  the Greater Seg.

The whole *Oblique Triangle*  $ACB$  being thus resolved into the two *Right-angled Triangles*  $ACd$ , and  $BCd$ , the Angles  $A$ ,  $B$ , and  $C$  are found by the seventh Case of *Right-angled Triangles* foregoing.

Having thus pass'd through all the Cases of *Right* and *Oblique-angled Plain Triangles*, in each of which the absolute Necessity of *Decimal Numbers* to express the Length of the *Sides* sought, is sufficiently evident; I shall next shew, in brief, the Application of the foregoing Doctrine of *Plain Trigonometry* to several *Arts Mathematical*; intending thereby to convince those who purpose to learn them, of the Necessity of their first learning *Decimal Arithmetick*.

### The Use of Decimals in Navigation exemplified in all Kinds of Sailing.

#### 1. Plain Sailing.

In *Plain Sailing*, or That by the *Plain Chart*, the Parts of a *Triangle* receive new Denominations.

Thus, The *Base* is the *Difference of Longitude* or *Departure*;

The *Perpendicular* is the *Difference of Latitude*;

The *Hypothenuse* is the *Distance* the Ship has run;

The Angle at *Perpend.* is the *Course* of the Ship;

And the Angle at *Base* the *Complement* of the *Course*.

Admit

Admit a  
Ship fails  
from the  
Lat. North

51:30 on  
the Rumb.  
AC 598  
Nautic  
Miles  
whose  
Course is  
SW b W;  
Quere her  
Departure  
and Difference of Latitude ?

The Analogy for finding the Departure.

As Radius $90^{\circ}$	—	—	10,0000000
Is to the Distance run AC 598	—	=	2,7767012
So is the Sine of the Course C $56^{\circ} 15'$	—	—	9,9198464
To the Departure Westward from her former Meridian	}	497:2 =	2,6965476

The Analogy for the Difference of Latitude.

As the Radius $90^{\circ}$	—	—	10,0000000
Is to the Distance run AC 598	—	=	2,7767012
So is the Co-sine of the Course $33^{\circ} 45'$	—	—	9,7447390
To the Difference of Latitude 332:2	—	=	2,5214402

But 332,2 Miles are equal to  $5^{\circ} 32,2'$ , and the Ship's Course being South-westerly.

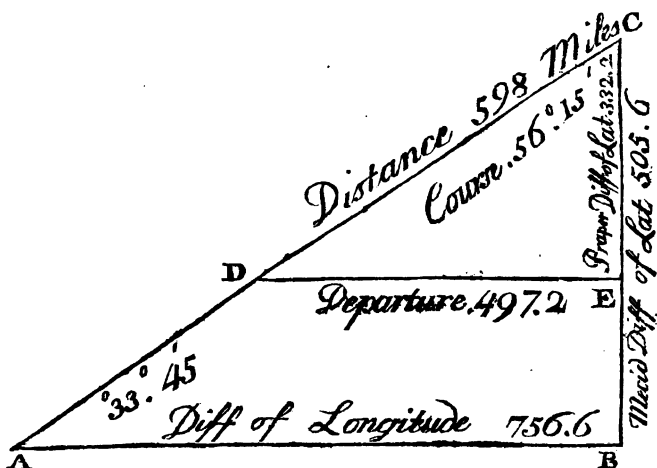

Therefore from the Latitude failed from	—	$51:30'$ N.
Subtraet the Difference of Latitude	—	$5:32,2$
Remains the Latitude come to	—	$45:57,8$ N.

The same Case follows in

Mercator's

## Mercator's Sailing.

*Mercator's Sailing*, or That calculated by his *Chart*, is much more correct and exact than *Plain Sailing*: For in this *Chart* the Degrees of *Latitude* increase according as the Degrees of *Longitude* decrease; and these Increments of the Degrees of *Latitude* are called the *Meridional Parts*; of which a Table is composed, by Means of which *Mercator's Chart* is constructed, on which a Ship's *Distance*, *Course*, proper and increased *Difference of Latitude*, the *Departure* and *Difference of Longitude*, are truly laid down or delineated, as in the *Scheme* subjoin'd.

The *Analogy* for the *Difference of Longitude*.

$$\begin{array}{r}
 \text{As Radius } 90^{\circ} \quad \text{---} \quad \text{---} \quad \text{---} \quad 10,000,000 \\
 \text{Is to the Increased Differ. of Lat. } 505:6 = 2,703,8071 \\
 \text{So is the Tangent of the Course } 56^{\circ}:15' \quad \text{---} \quad 10,175,1074 \\
 \text{To the Difference of Longitude } 756:6 = 2,878,9145
 \end{array}$$

The same Case and Data follow in

Middle

*Middle Latitude Sailing.*

This kind of *Sailing* is computed from the *middle Parallel of Latitude*, which is *half the Sum* of the *two Latitudes* of the Places, sail'd from, and come to; and depends altogether on the following *general Theorem* or *Analogy*.

As the *Co-sine* of *Middle Latitude*  
Is to the *Tangent* of the *Course*,  
So is the *Difference* of *Latitude* in Miles, &c.  
To the *Difference* of *Longitude* in Miles, &c.

The Reason of this *general Analogy* is evident in the following Scheme and is deduced therefrom.

*Explanation of the Scheme.*

- $IK = IL$  Is the *Middle Latitude* 48.44.
- $CM = CH$  The *Co-sine* of the *Middle Latitude*.
- $AD = MF$  The *Difference* of *Latitude*.
- $DE$  The *Departure* *Westward*.
- $FG$  The *Difference* of *Longitude*.
- $AE$  The *Distance* sail'd.
- $EAD$  The *Rhumb* or *Course* *SW* by *W*.
- $BC$  The *Tangent* of the *Course*.

Now 'tis manifest As  $CM : CB :: MF : FG$ , which is the same as the *Analogy* above in Words at length,

## 322 *The Use of Decimals in Fortification.*

The *Analogy* for the *Difference of Longitude.*

As the <i>Co-fine</i> of Middle Lat. 48.44	<sup>0</sup> / <sub>1</sub> <i>arith.</i> C. 0,1807427
Is to the <i>Tangent</i> of the Course 56.15	— 10,1758074
So is the <i>Difference of Latitude</i> 332.2	= 2,5213996
To the <i>Difference of Longit.</i> 753.7	= 2,8772497

*Note 1.* The Proportions for finding the *Difference of Latitude* and *Departure* in *Mecator's* and *Middle Latitude Sailing*, are the same as in *Plain Sailing*, and therefore not repeated.

2. That *Mecator's Sailing* gives the *correct Difference of Latitude* and *Longitude* both; *Middle Latitude Sailing*, only the *correct Difference of Longitude*; *Plain Sailing* gives neither *correctly*; and therefore their *Merits* are in *Proportion*.

3. That *Middle Latitude Sailing* agrees with *Plain Sailing* in some *Respects*; and with *Mercator's* in others, very *nearly*; and therefore is to be used accordingly.

4. That from the foregoing Instance it is evident no exact *Calculations* in *Navigation* can be made without *Decimal Numbers*; and though I have express'd but one *Place of Decimals*, yet three *Places* more may be easily found by *Problem 3. of Logarithms*.

## *The Use of Decimals in Fortification.*

A *Fort* is a Piece of Ground in Form of a *Polygon regular* or *irregular*, environ'd with a *Rampier*, or *Wall*, and a *Ditch* to impede the *Assaults* of an *Enemy*.

A Scheme of a *regular Pentagonal Fort*, with its *Explanation*, is here after subjoin'd.

*The*

The Explanation, or Names of the several Parts.

1. The Curtaine	—	—	—	ON
2. The Bulwark or Bastion	—	—	—	NEGHT
3. The Front of the Bulwark	—	—	—	FG
4. The Flank	—	—	—	NF

*A Table of the Dimensions of the Angles observed in Fortifying the regular Polygons following.*

Number of the Sides of the Polygons.	V.		VI.		VII.		VIII.		IX.		X.	
	D	M	D	M	D	M	D	M	D	M	D	M
Angle at the Centre	72,00		60,00		51,26		45,00		40,00		36,00	
Angle of the Polygon	108,00		120,00		128,34		135,00		140,00		144,00	
Half thereof	54,00		60,00		64,17		67,50		70,00		72,00	
To which always add	15,00		15,00		15,00		15,00		15,00		15,00	
The Flanked Angle	69,00		75,00		79,17		82,50		85,00		87,00	
The Half thereof	34,50		37,50		39,58		41,25		42,50		43,50	
Inward Flank Angle	19,50		22,50		24,39		26,15		27,50		28,50	
Which add to a Right Angle	90,00		90,00		90,00		90,00		90,00		90,00	
Angle of the Shoulder	109,00		112,00		114,39		116,15		117,50		118,50	
Angle opposite to the Head Line	59,50		62,50		64,39		66,15		67,50		68,50	
Angle opposite to the Front	86,00		80,00		75,43		72,50		70,00		68,00	
Complement of S G F, viz.	73,00		67,50		65,41		63,45		62,50		61,50	
Outward Flanking Angle	141,00		135,00		131,22		127,50		125,00		123,00	
Angle fronting the Flank	40,00		42,00		40,00		40,00		40,00		40,00	

The

Tho' 'tis not necessary the Angles in Forts should be precisely such as are before assign'd; yet supposing them to be such, I shall shew how to determine the Quantity of the Sides and Lines of the Pentagonal Fort above in Decimal Numbers by Trigonometrical Calculations, having the Length of the Curtaine and Front of the Bulwark given.

Admit the Curtaine be  $ON = 140$  } Yards.  
 And the Front of the Bulwark  $FG = 92$  }

Then the Analogy for the Sine  $SF$ , is

As the Radius  $90^\circ$  — —  $10,0000000$   
 Is to the Front of the Bulwark  $FG = 92 = 1,9700368$

So is the Sine of the Angle  $SFG 19.30'$  —  $9,5235000$   
 To the Sine —  $SF = 31.15 = \underline{1,4935368}$

Again; As Radius  $90^\circ$  — —  $10,0000000$   
 Is to the Front of the Bulwark  $FG = 92 = 1,9700368$

So is the Co-sine of Angle  $SFG 70.30'$   $9,9743466$   
 To the Line —  $SG = 87.98 = \underline{1,9443834}$

Then  $SG = 87.98$ , and  $SI = 70$ . Therefore the whole  
 Sine  $KG = 315.96$ .

Again; as the Sine of the Angle  $IAG 30.00'$  A.C.  $0,2307813$   
 Is to  $\frac{1}{2} KG = IG = 157.98$  —  $= 2,1986500$

So is Radius  $90^\circ$  — —  $10,0000000$   
 To the Semidiameter  $AG = 268.8 = \underline{2,4294313}$

Again; as the Sine of the Angle  $IAG 30.00'$  A.C.  $0,2307813$   
 Is to  $\frac{1}{2}$  the Side of the Pentagon  $IG = 157.98 = 2,1986500$

So is the Sine of the Angle  $AGI 54.00'$  —  $9,9079576$   
 To the Perpendicular  $AI = 217.4 = \underline{2,3373889}$

Again;

326 *The Use of Decimals in Fortification.*

Again, as the Sine of the Angle  $FCE$   $86.00$  *A. C.*  $0.0010592$   
 Is to the *Front*  $FG = 92$  — — =  $1,9700368$

So is the Sine of the Angle  $FGC$   $34.30$   $9,7531280$   
 To the Line  $FC = 52.99$  — — =  $1,7242240$

Also, as the Sine of  $FCG$   $86.00$  *Arith. C.*  $0.0010592$   
 Is to the *Front*  $FG = 92$  — — =  $1,9700368$

So is the Sine of the Angle  $GFC$   $59.90$   $9,9253204$   
 To the *Head Line*  $EG = 80.61$  — — =  $1,9064164$

Then  $AG - CG = AC = 188.19$  the *Semidiameter* of  
 the inner *Pentagon*.

Again, as *Radius*  $90$  — — —  $10,0000000$   
 Is to the Line  $FC = 52.99$  — — =  $1,7242240$

So is the Sine of the Angle  $FCN$   $40.00$   $9,8080675$   
 To the *Flank*  $FN = 34.06$  — — =  $1,5322915$

Then  $FN + SF = ID = 65.21$ . And  $AI - ID =$   
 $AD = 152.19$

Again, as *Radius*  $90$  — — —  $10,0000000$   
 Is to the Line  $FC = 52.99$  — — =  $1,7242240$

So is the Sine of the Angle  $NFC$   $50.00$   $9,8842540$   
 To the *Gorge Line*  $NC = 40.59$  — — =  $1,6084780$

Then  $NC + ND = DC = 110.59$  And  $2DC = BC = 221.18$

Again, as the Sine of  $FP$   $69.30$  *Arith. C.*  $0,4765047$   
 Is to the *Flank*  $FN = 34$  — — =  $1,5322915$

So is the Sine of the Angle  $FPN$   $70.30$   $9,9743466$   
 To the Line  $PN = 96.19$  — — =  $1,9831428$

Then  $ON - PN = OP = 43.81$  the *second Flank*.  
 And  $ON + SG = RG = 227.98$ . Then in the Trian-  
 gle  $ROG$  As

326

*The Use of Decimals in Altimetry, &c.* 327

As the Line  $RO (= ID) = 65.21$  A. C. 8,1856858  
 Is to the Line  $RG = 227.98$  — = 2,3578967

So is *Radius*  $90^{\circ}$  — — 10,0000000

To the *Tangent* of the Angle  $ROG$   $74^{\circ}02'$  10,5435825

Then, as the *Sine* of  $ROG$   $74^{\circ}02'$  *Arith. C.* 0,0170850  
 Is to the *Sine*  $RG = 227.28$  — = 2,3578967

So is *Radius*  $90^{\circ}$  — — 10,0000000

To the *Line of Defense*  $OG = 237.13$  — 2,3749817

Thus having the *Angles* as in the *Table*, you are here taught the Manner of finding the *Sides* and *Sines* of any *regular Fort*, in any Measure, and *Decimal Parts* thereof.

*The Use of Decimals in Measuring Heights, Depths, and Distances; both accessible and inaccessible.*

1. *Altimetry*, or the Mensuration of *Altitudes* and *Depths*, is thus performed.

Let  $AB$  represent a *Tower* whose *Height* is required.

Suppose  $\begin{cases} \text{The Distance } AC = 26.37 \text{ Yards.} \\ \text{The Angle } ACB \text{ (found by a Quadrant) } 51.30. \end{cases}$

The *Analogy* for finding the *Height A B*.

As Radius  $90^{\circ}$  — — — 10,0000000  
 Is to the Distance  $AC = 26.37$  — = 1,4211101  
 So is the Tangent of  $ACB \ 51^{\circ}30'$  — 10,0993248  
 To the Height of the Tower  $AB \ 33.15$  = 1,5205049

And thus the *Height* or *Altitude* of any other *accessible* Object may be found.

Suppose the *Steeple AB* be *inaccessible* for the River  $R I$ ; Then with a *Quadrant* at  $C$  take the Angle  $ACB$ , and measure a *Distance* to  $D$ , where take again the Angle  $ADB$ ; and let those *Angles*, and the *Distance* be as in the adjoin'd Figure.

Then  $DB$  must be found by this *Analogy*.

As the Sine of  $CBD \ 14^{\circ}30'$  — C. A. 0,6014004  
 Is to the Sine of  $BCD \ 32^{\circ}15'$  — 9,7272276  
 So is the *Distance* or Side  $CD = 24.56$  = 1,3902284  
 To the *Visual Line*  $DB = 52.34$  — = 1,7188564  
 Having

*Altimetry, or Measuring Altitudes.* 319

Having found  $DB$ , you may find  $AB$ , thus;

As Radius  $90^\circ$  — — — — — 10,000,000  
 Is to the Line  $DB = 52.34$  — — — — — = 1,718,8564

So is the Sine of  $ADB 46.45'$  — — — — — = 9,862,3526

To the Height required  $AB = 38.12$  — — — — — = 1,581,2090

Thus you find the Height of any inaccessible Objects.

If the Object whose Height you would measure standeth aloft, as on a Hill, &c. as the Tower  $AB$ ; then take the

Angles  $BCE 35.00'$ ,  $ACE 20.30'$ ; then from  $C$  measure the Distance  $CD = 28.6$  Yards, and at  $D$ , take the Angles  $BDE$

$52.30'$ , and  $ADE 32.30'$ , as below.

Then the Analogy for finding the Side  $DB$ , is

As the Sine of  $BCD 35.00'$  — Arith. Com. 0,5218582

Is to the Sine of  $BCD 35.00'$  — — — — — 9,758,913

So is the Side or Distance  $CD = 28.6$  — — — — — = 1,456,3660

To the Visual Line  $DB = 54.55$  — — — — — = 1,736,8155

U n Then

Then say, as the Sine of Complement of  $BAD$   
 (to  $180^\circ$ )  $57.30^\circ A.C.$  — — — — — } 0,0739708

Is to the Sine of  $BDA$   $20.00$  — — — — — 9,5340517  
 So is the Side  $DB = 54.55$  — — — — — + = 1,7368155

To the Height of the Object  $AB$  ~~is~~  $22.12 =$  1,3448380

Depths, if Perpendicular, are most conveniently measured with a Line and Plumet; but if the Depth be slanting, such as Valleys, &c. and the perpendicular Profoundity be required; do as follows.

Let  $ABC$  be a Valley, whose oblique Descents or Sides are  $AB$ , and  $BC$ ; and its perpendicular Depth  $BD$  required. Then measure the Side  $AB$ , or  $BC$ , and take with a Quadrant the Angle  $ABD$ , or  $DBC$ , whereby the others will be known; then (supposing them as below) use the following Analogy.

The Analogy for finding the Depth  $DB$ .

As Radius  $90^\circ$  — — — — — 10,0000000  
 Is to the slant Descent  $AB = 26.15$  — — — — — = 1,4174717

So is the Sine of  $BAD$   $50.30$  — — — — — 9,9106860

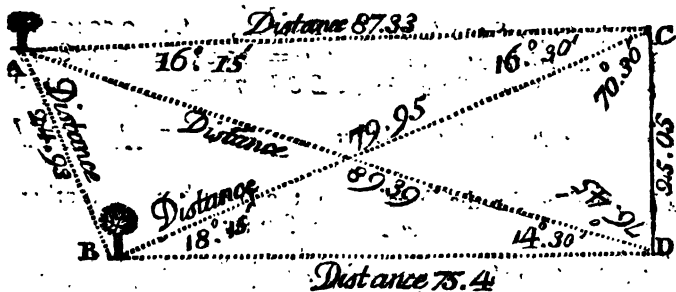

To the Perpendicular Depth  $DB = 21.28 =$  1,3281577

The same might have been equally found by the other Right-angled Triangle  $CDB$ , by the same Method.

2. Longimetry, or the Menfuration of the Distances of Objects, either from Us, or from one another, is thus performed.

Let *A, B*, be two Trees; and let it be required to find the Distance of *A* from *C* or *D*; as also of *B* from the same two Points; and the Distance of *A* from *B*.

Having (by a Theodolite or Semicircle) at *D*, found the Angles *BDC*, and *ADB*; and at *C* the Angles *ACD* and *ACB*; and measured the Distance of the two Stations *CD*, as below: Use the following Analogies.

The Analogy for finding *AC*.

As the Sine of the Angle  $\overset{\circ}{C}AD$   $16.15$  A. C.  $0.5531072$   
Is to the Distance of Stations  $CD = 25.05 = 1,3988077$

So is the Sine of the Angle  $ADC$   $76.45$  —  $9,9882821$

To the Distance  $AC = 87.33$  . —  $= \underline{1,9411972}$

The Analogy for the Distance *AD*.

As the Sine of the Angle  $\overset{\circ}{C}AD$   $16.15$  A. C.  $0.5531072$   
Is to the Distance of Stations  $CD = 25.05 = 1,3988077$

So is the Sine of  $ACD$   $87.00$  —  $= 9,9994044$

To the Distance  $AD = 89.39$  . —  $= \underline{1,9513193}$

## The Use of Decimals in

The *Analogy* for the Distance BC.

As the Sine of the Angle CBD  $18.15$  A. C.  $0,5042284$   
 Is to the Distance of Stations CD  $25,05 = 1,3988077$   
 So is the Sine Comp. of the Angle BDC }  $9,9997974$   
 (to  $180$ )  $88.15$  — }  
 To the Distance BC  $= 79,95 = 1,8028399$

The *Analogy* for the Distance BD.

As the Sine of the Angle CBD  $18.15$  A. C.  $0,5042284$   
 Is to the Distance of Stations CD  $= 25,05 = 1,3988077$   
 So is the Sine of the Angle BCD  $70.30$   $9,9743466$   
 To the Distance BD  $= 75,4 = 1,8773827$

The *Analogy* for the Distance of the Trees from each other,  
 viz. AB. But first say

As the Sum of the two Sides,  $AC + CB = 167,28$  Arith. Comp. }  $7,7765050$   
 Is to their Difference  $AC - CB = 7,38 = 0,8680564$   
 So is the Tang. of half the Angles  $AEC + BAC$  }  $9,9954822$   
 $81.45$  — — — }  
 To the Tangent of half their Difference }  $8,6400436$   
 $AEC - BAC$   $2.30$  — — — }

Then the Angle CBA  $84.15$ ; and the Angle BAC  $79.15$ ,

Wherefore the *Analogy* for the Distance AB, is,

As the Sine of the Angle ABC  $84.15$  A. C.  $0,9021917$   
 Is to the Distance of AC  $= 87,33 = 1,9411972$   
 So is the Sine of the Angle ACB  $16.30 = 9,4533418$   
 To the Dist. of the two Trees AB  $= 24,93 = 1,3967307$

Thus

Thus I have endeavoured to make it appear how absolutely necessary the Use and Knowledge of the noble Art of *Decimal Arithmetick* is in those Parts of *Mathematical Science*, which require *Trigonometrical Calculations*, by Examples in the most common and useful Arts; I might have gone farther, and shewn its Use in several Parts of *Astronomy*, &c. but I intend only an instructive *Specimen* of its excellent Use in this Kind of Learning, and such I presume this Chapter will be found to be.

C H A P. XIV.

The great Use of DECIMALS in the Mensuration of all Kinds of Superficies and Solids.

**I**N this *Treat* (wherein the Use of *Decimal Arithmetick* is most obvious, necessary, and excellent) I have only this to advise the Reader, That the Numbers are absolutely taken; and may represent any *Dimensions*, as *Inches, Feet, Yards, Rods, Miles, Acres*, &c. in the *Area's*, and *Solid Content* of Bodies. And that after the *Area*, or *Content* is found, I shall shew the Manner of Reducing it to any of the *Dimensions* used in *Surveying, Gauging*, &c. by means of *Decimals*.

Proposition I. To measure a Square.

Rule. Multiply a Side into it self, the Product is the Area or Square Content.

Example. Suppose the Side AB = 12,6  
Multiply by it self, — 12,6

9) 760  
844  
2533  
12866

The Square Content or Area is = 150,4

Propo.

Proposition 2. To Measure a Parallelogram.

*Rule.* Multiply the *Length* by the *Breadth*, the Product is the *Area*, or *Content*.

*Example.* Mult. the *Length*  $AB=16,5$   
By the *Breadth*  $BD=8,6$

$$\begin{array}{r} 990 \\ 1320 \\ \hline \end{array}$$

The Product is the *Content* = 141,9

Proposition 3. To Measure a Rhombus.

*Rule.* Multiply one Side into the *perpendicular Height*, the Product is the *Area* or *Content* required.

*Exam.* Mult. the Side  $AB=20,75$   
By the *Height*  $BD=16,4$

$$\begin{array}{r} 8303 \\ 12445 \\ 207375 \\ \hline \end{array}$$

The Product is the *Area* = 340,424

Proposition 4. To Measure a Rhomboides.

*Rule.* Multiply the *Length* by the *perpendicular Height*, or *Breadth*, the Product is the *Content*.

*Ex.* Mul. the *Length*  $AB=1,28$   
By *Breadth* or *Height*  $AC=,56$

$$\begin{array}{r} 768 \\ 640 \\ \hline \end{array}$$

The Prod. is the *Area* = 0,7168

Proposition 5. To Measure a Plain Triangle.

*Rule.* Multiply the *Base* into half the *Perpendicular Height*; or the *Whole perpendicular Height* into half the *Base*; the Product will give the *Area*.

*Ex.*

Exam. Mult. the Base  $AB = 10,8$   
 By half the Height  $CD = 4,2$

$$\begin{array}{r} 21\bar{6} \\ \times 4,2 \\ \hline 4335 \end{array}$$

The Product is the Area = 45,73

Proposition 6. To Measure a Trapezium.

Rule. Multiply the Diagonal into the half Sum of the two Perpendiculars; or the Contrary; and the Product will be the Area or Superficial Content.

Ex. Mul. the Diagonal  $AB = 10,5$

By the  $\frac{1}{2}$  Sum of the Perpendiculars  $bc = 3,3$

$$\begin{array}{r} 315 \\ \times 3,3 \\ \hline 315 \end{array}$$

The Prod. is the Content = 34,65

Proposition 7. To Measure a Parallelepipedon.

Rule. Multiply the Diagonal by the half Sum of the two Perpendiculars, the Product is the Area.

Exam. Mult. the Diagonal  $AB = 14,3$

By  $\frac{1}{2}$  Sum of  $cd$  and  $cb = 6,3$

$$\begin{array}{r} 430 \\ \times 6,3 \\ \hline 800 \end{array}$$

The Product is the Content = 90,3

Proposition 8. To Measure an irregular Polygon, or Polygram.

Rule. Divide all such multangular and irregular Figures into Trapeziums and Triangles, then measure them by Prop. 5 and 6.

Example.

Proposition 10. To find such constant Multipliers for any of the Regular Polygons, That multiplying the Square of any Side thereby, the Product shall be the Area of the Polygon.

Example. In a Pentagon.

Div. the whole Circle, viz. 360 Deg.  
By the Number of Sides ; here 5.  
The Quotient is the  $\angle BCD = 72^\circ$   
The  $\frac{1}{2}$  thereof is the  $\angle ACB = 36^\circ$   
Whose Comp. is the  $\angle ABC = 54^\circ$

Then make this Proportion ;

	<i>Arith. C.</i>
As the Sine of the Angle $ACB = 36^\circ$	= 0,2307813
Is to half the Side ( $= 1$ , always)	= 5 = 9,6989700
So is the Sine of the Angle $ABC = 54^\circ$	= 54 = 9,979576

To the Perpendicular, or Radius of the inscrib- ed Circle	}	$AC = ,68819 = 9,8377089$
---	---	---------------------------

Then (by the last Proposition.) <i>Arith. Comp.</i>	= 0,68819
Multiplied into $\frac{1}{2}$ Sum of the Sides	= 2,5

	344095
	137638
	1720475

The Product is the Area — — = 1,720475

And thus may the Area for any other Polygons be found whose Side is 1. And this Area will be the constant Multiplier for that kind of Polygon. A Table of such Multipliers, or Area's, for the several Regular Polygons follow.

X x

Sides

Sides.	Names.	Multipliers.
3	Trigon	0,433013
4	Tetragon	1,000000
5	Pentagon	1,720475
6	Hexagon	2,598076
7	Heptagon	3,633959
8	Octagon	4,828427
9	Enneagon	6,181827
10	Decagon	7,694209
11	Endecagon	8,514250
12	Dodecagon	9,330125

Now as these are the *Area's* of each *Polygon* respectively, whose Side is 1; and as the *Area's* of *Like Figures*, are as the *Square* of their *homologous*, or *like Sides*; therefore the *Square* of a Side of any of those *Polygons* multiplied into its respective *Area* in the Table, will produce the true *Area* thereof.

*Example.* Suppose the Side of a *Heptagon* be 10; the *Square* of which is 100; but  $100 \times 3,633959 = 363,3959 =$  *Area* of such a *Heptagon*, and the like for any other.

**Proposition 11.** *To Measure a Circle.*

*Rule.* Multiply the *Square* of the *Diameter* (if that be given) by 0,7854; the *Product* is the *Area*. Or, (if the *Periphery* be given) Multiply the *Square* of the *Periphery* by 0,07957; the *Product* is the *Area*, as before.

*Exa.* Suppose the *Di-* }  $AB = 5,2$   
*ameter* of a *Circle* be }

$$\begin{array}{r} 5,2 \\ \hline 104 \\ \hline 260 \end{array}$$

The *Square* thereof is = 27,04 A

Which multiply by —,7854

$$\begin{array}{r} 40816 \\ \hline 13520 \end{array}$$

$$21632$$

$$18928$$

$$\hline 21,237216$$

The *Area* of the *Circle* is = 21,237216

Put

*Measurement of Superficies and Solids.* 339

Put  $D = \text{Diameter}$ ;  $P = \text{Periphery}$ ; and  $A = \text{Area}$ , of any Circle.

Then it will be  $\left\{ \begin{array}{l} 3,1416D = P. \text{ And } 0,7854DD = A. \\ 0,3183P = D. \text{ And } 0,07957PP = A, \\ \sqrt{1,2732} = D. \text{ And } \sqrt{12,5664} = P. \end{array} \right.$

Thus by these six *Theorems* may all the Varieties relating to the *Diameter*, *Periphery*, and *Area's* of Circles be solved.

**Proposition 12.** *To Measure a Semicircle.*

*Rule.* Multiply half the *Semicircular Arch*, into half the *Diameter*; the Product is the *Area*.

*Exam.* Multiply  $\frac{1}{2} ABC = 4,23$   
 Into  $\frac{1}{2} AC = EC = 2,76$

$$\begin{array}{r} 2600 \\ 30333 \\ 86666 \\ \hline \end{array}$$

The *Semicircular Area* = 11,96

**Proposition 13.** *To Measure the Sector of a Circle.*

*Rule.* Multiply half the *Arch* into the *Radius*, the Product is the *Area* of the *Sector*.

*Example.* Multiply  $\frac{1}{2} AB = 4,53$   
 Into the *Radius*  $AC = 11,16$

$$\begin{array}{r} 2718 \\ 453 \\ 453 \\ 453 \\ \hline 50,5548 \end{array}$$

X x 2

Propo.

**Proposition 14. To Measure the Segment of a Circle.**

*Rule.* Complete the Sector  $ACBD$ , and measure it by the last Proposition; and then find the Area of the Triangle  $ABC$  by Proposition 4. Then subtract the Area of the Triangle from the Area of the Sector, the Remainder is the Area of the Segment.

Or thus, (by the Curious Theorems of Mr. Ward.)

Let  $R =$  The Radius, or Semidiameter  $AC$ .  
 Let  $d =$  The Diff between the versed Sine and Radius.  
 $C =$  Half the Chord or Base of the Seg.  $AE$  (viz.  $EC$ .)

*Theorem*  $\left\{ \frac{2\frac{1}{2} RR - \frac{1}{2} Rd - dd}{1\frac{1}{2} R + d} \right\} \times C = S$ , The Area of the Segment.

**Proposition 15. To Measure an Ellipsis.**

*Rule.* Multiply the Transverse and Conjugate Diameters into each other; then multiply that Product by the Number 0,7854, the Product is the Area required.

*Exam.* Mult. the Transverse  $CD = 36$   
 By the Conjugate  $AB = 16$

	216
	36
	-----
The Product is	576
Multiply that by	0,7854
	-----
	2304
	2880
	4608
	4032
	-----

The Area of the Ellipsis = 452,3904

Propo.

Proposition 16. To Measure the Parabola.

*Rule.* Multiply the *Greatest Ordinate*, or *Base*, into the perpendicular *Height*, and that *Product* by the single *Repetend*,  $\theta$ , the *Product* is the *Area*.

*Ex.* Mult. the *Ordinate*  $AB=53,75$   
By the *Abscissa*, or *Height*,  $CD=43,3$

$$\begin{array}{r} 16125 \\ 16125 \\ \hline 21500 \end{array}$$

Multiply this *Product*  $= 2327,375$   
By the *Repetend*  $= \theta$

$$\begin{array}{r} 2327,375 \\ \hline 9)13966250 \end{array}$$

The *Area* of the *Parab.*  $= 1551,80\bar{x}$

*Note,* an easier way is to multiply the *first Product* by  $2\theta$  and then divide by 3 for the *Area*; since  $\frac{2}{3} = \theta$

Proposition 17. To Measure the Circular Space, called a Lune; (being like the falcated Moon.)

*Rule.* In order to find the *Area* of the *Lune*  $AEBD$ , seek first the *Area* of the *Semicircle*  $AEB$ , by *Prop.* 12.

Then find the *Area* of the *Segment*  $ADBF$  of the *Circle*  $ADBG$ , by *Prop.* 14.

Lastly; Subtract the *Area* of the *Segment* from the *Area* of the *Semicircle*; there remains the *Area* of the *Lune* required.

Alfo

Also the two Lunes A, B, are together equal to the Triangle C.

Note, This is call'd the Quadrature, or Squaring the Lunes of Hippocrates.

Proposition 18. To Measure the Cycloid.

Rule. Find the Area of the Circle C, described on the Axis DE, and multiply that by 3, the Product is the Area of the Cycloid (called also the Trochoid) A E B D.

Proposition 19. To Measure a Spherical Triangle.

Rule. From the Sum of the three Angles, subtract 180 Degrees, multiply the Superficies of the whole Sphere or Globe by the Remainder; this Product divide by 720, the Quotient is the Content or Area of the Triangle.

Exam. Suppose the Angles

$$A + B + C = 217.02^\circ$$

From that Sum Subtract  $180^\circ$

Mult. the Remainder = 37.02

By the Surface of the Sphere } = 2642

7406

148123

222000

740666

Divide by 720) 97842,06 (135,891 = Area of the Triangle.

Note,

*Note,* This is a very *uncommon, curious, and useful* Proposition.

**Mensuration of Solids.**

**Proposition 20.** *To Measure a Cube.*

*Rule.* Multiply the *Side* of the *Cube* into it self, and that Product again by the *Side*; this last Product will be the *Solid Content*, or *Solidity* of the *Cube*.

*Exam.* Mult. the Side  $AB = 5,7$   
 By it self — —  $5,7$   

---

  
 $399$   
 $285$

This Product — —  $32,49$   
 Multiply again by — —  $5,7$   

---

Proposition 27. To Measure a Sphere, or Body perfectly Round.

*Rule.* Multiply the Diameter into the Circumference, the Product is the Superficial Content; then multiply that by  $\frac{1}{3}$  of the Diameter, the Product will be the Solid Content of the Sphere.

*Example.* Of the Superficial and Solid Content.

Mult. the Periphery of the Globe or Sphere, ACBD =	62,832
By the Axis of the Sphere AB =	20
<hr/>	
The Spherical Superficies =	1256,640
Which mult. by $\frac{1}{3}$ of AB =	8
<hr/>	
	923769,92

The Solid Content = 4188,8 of the Sphere.

Proposition 28. To Measure any Frustum or Segment of a Sphere or Globe.

1. Let

1. Let  $\left\{ \begin{array}{l} D = \text{Diameter of the} \\ \text{Sphere } C E \\ H = \text{Height of the Seg-} \\ \text{ment } C D \end{array} \right.$

Then  $\frac{3DH^2 - 2H^3}{1,92}$  = The Content.

Of the Polar Segment ACB.

2. Let  $\left\{ \begin{array}{l} D = \text{Diameter } C E, \text{ as} \\ \text{before,} \\ x = \text{the Base } AB = G I. \\ H = \text{the Thickness } D F. \end{array} \right.$

Then  $\frac{2DD + x^2}{3,82} \times H$  = the Middle Segment ABFG, called the Zone. By these two Theorems, may the Solidity of any Segment of a Globe or Sphere be found.

To find the Superficial Content of any Segment, as

Thus  $\left\{ \begin{array}{l} \text{As the Axis, or Diameter of the Sphere,} \\ \text{Is to the whole Superficies of the Sphere;} \\ \text{So is the Height of any Segment,} \\ \text{To the Area of its Curve Superficies.} \end{array} \right.$

Proposition 29. To find the Content of a Spheroid.

Rule. Multiply the Square of the Diameter of the Greatest Circle, by the Length; then multiply that Product by 0,5236; this last Product will be the Solidity of the Spheroid.

Exam.

The Use of Decimals in the

Exam. Square the Diameter }  
of the greatest Circle, CD = } 6,5

6,5

16928  
—  
76176  
—  
25392

The solid Content = 332,38128 of the Parabolic Conoid.  
Propo,

Proposition 31. To Measure the Frustrum of a Parabolic Conoid.

Rule. Add the Square of the Diameter of the Lesser Base to the Square of the Diameter of the Greater Base, Divide that Sum by 2,5464; then multiply the Quotient by the Height; the Product is the Solid Content.

Exam. The Square of  $AB = 84,64$   
 And the Square of  $EF = 40,96$   
 Sum of the Squares  $= 125,6$

Then  $2,5464 \overline{) 125,600} \begin{array}{r} 49,3244 \\ 101856 \\ \hline 237440 \\ 229176 \\ \hline 8264 \end{array}$   $5 = CD$  the Height.  
 $246,622 =$  the Solidity of the  
 (Frustrum  $ABFE$ ).  
 8264 &c.

Proposition 32. To Measure a Parabolic Spindle, or Pyramidoid.

Rule. Multiply the Square of the Diameter of the Greatest Circle, by the Length; and that Product by 0,41888; this last Product is the Solid Content of the Spindle.

Exam. 1. Square the }  
 Diameter of the } 6,05  
 Greatest Circle  $AB$  }

$6,05$   
 $\hline 3025$   
 $36300$

Mult. this Square  $36,6025$   
 By the Length  $CD = 8,5$   
 $\hline 1830125$   
 $2928200$

This Product  $311,12125$   
 Multiply by  $,41888$

Solid Cont.  $= 130,3224692$  of the Parabolic Spindle.

Example.

*Example 2. To Measure the Middle Segment of the spindle, EGHF.*

Let  $\left\{ \begin{array}{l} D = \text{the Diameter of the greatest Circle } AB. \\ C = \text{the Diameter of either Base or End } EF \text{ or } GH. \\ x = 2BK = \text{the Excess of } AB \text{ above } EF, \text{ or } GH. \\ L = \text{the Length of the Frustum } FH. \end{array} \right.$

*Theorem*  $\left\{ \frac{2DD + CC - 0,4xx}{3,82} \times L = \right\}$  *Solidity of the middle Frustum.*

*Proposition 33. To Measure any of the Five Regular (or Platonic) Bodies.*

Those Bodies being only an *Aggregate* of so many *Pyramids* as they consist of *Sides*, each *Side* being the *Base* of a *Pyramid*, may, with due *Consideration*, be measured by *Proposition 22*. However for the more ready and expeditious *Practice*, I shall here subjoin a *Table* of the *Solidity* and *Superficies* of each *Body* whose *Side* is 1. or *Unity*.

<i>Sides.</i>	<i>Names.</i>	<i>Superficies.</i>	<i>Solidity.</i>
4 <i>Tri.</i>	<i>Tetrahedron</i>	1,732051	0,1178511
6 <i>Sq.</i>	<i>Hexahedron</i>	6,000000	1,0000000
8 <i>Tri.</i>	<i>Octahedron</i>	3,464102	0,4714045
12 <i>Pent.</i>	<i>Dodecahedron</i>	20,645729	7,663119
20 <i>Tri.</i>	<i>Icosahedron</i>	8,660254	2,181695

To use the preceding *Table* for finding the *Superficies* of any of those five *Bodies*, do thus ;

*Square* the *Given Side* of the *Body*, and by that multiply the *Tabular Superficial Number*; the *Product* is the *Superficies* of the *Body*, which was sought.

*Hexahedron.*

*Exam-*

Tetrahedron.

Example. Suppose the Side of the Dodecahedron be 8, the Square of which is 64.

Octahedron.

Then multiply the Tab. Numb. 20,645729  
By the Square of the Side 64

$$\begin{array}{r} 20,645729 \\ \times 64 \\ \hline 82582916 \\ 123874374 \\ \hline \end{array}$$

Superficial Content = 1321,326656

To find the Solid Content; Multiply the Tabular Number of the Solidity, by the Cube of the Side given, the Product is the Solid Content.

Dodecahedron.

Example. Of the aforesaid Dodecahedron.

Multiply the Tabular Numb. 7,663119  
By the Cube of the Side } 512  
(=8,) viz. — } 512

$$\begin{array}{r} 7,663119 \\ \times 512 \\ \hline 15320238 \\ 7663119 \\ 38315595 \\ \hline \end{array}$$

Solid Content = 3923,516928

Icosahedron.

And thus proceed for the Superficies and Solidity of the other Bodies.

Proposition 34. To Measure any solid or hollow Body how irregular soever.

Rule. Take any Vessel in Form of a Parallelopipedon, and fill it with Water to a certain Height, and then immerse  
Z z the

the *irregular Body* therein, and observe how much the *Water* is raised by the *Side* of the *Vessel*; for that *Water* is equal in *Quantity*, or *Solid Content*, to the *irregular Body*; and may be found by *Proposition 20*.

*Example*. Suppose the *Vessel* *BCDE*, in Form of a *Parallelopipedon*, whose *Length* is two *Feet*, eight *Inches*; and *Breadth* one *Foot*, ten *Inches*; and it be fill'd with *Water* to *FG*, twelve *Inches* Deep = *EF*. And it is required to measure the *Log* *A*, of a most *irregular Form*. In order to do this, I take and immerge the *Log* in the *Vessel* of *Water* (as in the lower *Figure*) and observe the *Water* rise from *FG* to *HI*, the *Height* of which (viz. *FH*, or *GI*) I measure, and find to be 5,5 *Inches*.

Then by *Proposition 20*, I find a *Body* of *Water*, 2 *Feet*, 8 *Inches* in *Length*; 1 *Foot*, ten *Inches* in *Width*, and 5,5 *Inches* Deep, to contain 3520 *Solid Inches*, or 2,037 *Solid Feet*; which therefore is the *Solid Content* of the *Log A*.

*Proposition 35*. To assign the *Dimensions* by which the several *Artificers* measure their *Work*.

Masons measure their Work by	{ Feet and Inches }	{	<i>Superficial</i> {	As Pavements, Chimneys, Pieces, Corniches, &c.
			<i>Solid</i> {	Columns, and o- ther <i>solid</i> Parts of Buildings.

Bricklayers mea- sure by the	{	<i>Foot</i> ; Arches, Quoins, Cornices, Fascia's, &c.
		<i>Yard</i> ; Pavements, Pieces, &c.
		<i>Rod</i> ; All manner of Walls, and Chimneys.
		<i>Square</i> ; All manner of Tying, and Slating.

Carpenters mea- sure by the	{	<i>Square</i> of {	Roofing, Partitioning, Floor- ing, &c.
		100 Feet }	

*Join-*

*Mensuration of Superficies and Solids.* 355

*Joiners, Painters, Plasterers* measure by the *Square Yard* for the most part; }  
 } seldom, by the *Foot Square*.

*Glasiers* measure their *Work* by the } *Decimal Foot Square*; very rarely by }  
 } *Inches and Quarters*.

*Solid Inches.*

*Gaugers* measure the *Area's* and *Content*, of *Superficies* and *Solids*, by }  
 } 231, For *Wine Gallons*.  
 } 282, For *Ale Gallons*.  
 } 268,8. For *Corn Gallons*.

*Surveyers* measure } *Rod* or *Pole*; but mostly by the *Chain*  
 } of an 100 *Links* = 4 *Rod*.

*Proposition 36. To assign Multipliers, and Divisors, whereby the Gauger may readily find any Area or Content in Gallons or Bushels, whether the Dimensions be taken in Inches, Feet, or Yards.*

This I shall do by disposing the Numbers in their proper Order in the Table subjoin'd.

<i>Dimensions.</i>	<i>Multipliers.</i>	<i>Divisors.</i>
<i>Inches.</i>	0.004329 <i>W. G.</i>	231 <i>W. G.</i>
	0.003546 <i>A. G.</i>	282 <i>A. G.</i>
	0.003722 <i>C. G.</i>	268.8 <i>C. G.</i>
	0.000465 <i>C. B.</i>	2150.42 <i>C. B.</i>
<i>Feet</i>	7.48052 <i>W. G.</i>	0.13368 <i>W. G.</i>
	6.12765 <i>A. G.</i>	0.16352 <i>A. G.</i>
	6.42448 <i>C. G.</i>	0.15565 <i>C. G.</i>
	0.80356 <i>C. B.</i>	1.24446 <i>C. B.</i>
<i>Yards</i>	67.32468 <i>W. G.</i>	0.014853 <i>W. G.</i>
	55.14885 <i>A. G.</i>	0.018168 <i>A. G.</i>
	57.82032 <i>C. G.</i>	0.017294 <i>C. G.</i>
	7.23204 <i>C. B.</i>	0.138273 <i>C. B.</i>
<i>Note,</i>	<i>W. G.</i> } <i>A. G.</i> } stands for <i>C. G.</i> } <i>C. B.</i> }	<i>Wine Gallons.</i> <i>Ale Gallons.</i> <i>Corn Gallons.</i> <i>Corn Bushels.</i>

*The Use of the preceding Table.*

If by the foregoing *Propositions* the *Area* or *Content* of any *Superficies* or *Solid* be found; and you would know how many *Wine, Ale, or Corn Gallons, or Bushels* it contains; Multiply, or Divide, the given *Area* or *Solidity*, by the *Tabular Number* corresponding to the *respective Measure, and Dimension*, the *Product* is the *Area* or *Content* sought in *Gallons, or Bushels*.

*Example.* Suppose the *Parallelopipedon* in *Example 1.* of *Proposition 20.* represent a *Cistern*, and the *Dimensions* there used be *Feet*; then the *solid Content* of the *Cistern* is there found to be 1349,95 *Solid* or *Cubick Feet*.

$$\text{Then } \left\{ \begin{array}{l} 1349,95 \times 7,48052 = \text{Content in Wine Gallons.} \\ 1349,95 \times 6,12765 = \text{Content in Ale Gallons.} \\ 1349,95 \times 6,42448 = \text{Content in Corn Gallons.} \\ 1349,95 \times 0,80356 = \text{Content in Corn Bushels.} \end{array} \right.$$

Or by Division.

$$\text{Thus } \left\{ \begin{array}{l} ,13368 \ 1349,95 (= \text{Content in Wine Gallons.}) \\ ,16352 \ 1349,95 (= \text{Content in Ale Gallons.}) \\ ,15565 \ 1349,95 (= \text{Content in Corn Gallons.}) \\ 1,24446 \ 1349,95 (= \text{Content in Corn Bushels.}) \end{array} \right.$$

And were *Dimensions* taken by a *Decimal Yard* or *Foot* (which are by far the best *Instruments* for *Mensuration*;) The *Business* of *Gauging* would be easy, and greatly expedited by a *Table* not before extant, that I know of.

*Note*; If you would find the *Content* of *Circular Area's* at one *Operation* (without reducing them by the *common Multiplier* 0,785398) do thus,

$$\text{Divide the Square of the Diameter by } \left\{ \begin{array}{l} 359,05 \text{ for Ale Gallons.} \\ 294,12 \text{ for Wine Gallons.} \\ 342,24 \text{ for Corn Gallons.} \\ 2738, \text{ for Corn Bushels.} \end{array} \right.$$

But

But in this Case the *Dimensions* must be understood of Inches only.

By what I have said in this *Proposition*, I suppose the dexterous young *Artist* will be easily apprised of the Nature, Manner, and Reason of *Gauging*; and how to apply the foregoing *Propositions* to that purpose.

**Proposition 37.** *To apply the foregoing Propositions of Superficial Mensuration to Surveying.*

Suppose a *Field* in Form of an *Irregular Polygon*; as *ABCDEFGHIH*, below.

The

358 *The Use of Decimals in the*

The Field being measured, *Plotted*, and the *Plot* resolved into *Trapezia*, and *Triangles*, as per *Proposition 8*.

Proceed to find the *Contents* of the *Triangles* by *Proposition 5*. and of the *Trapezia* by *Proposition 6*.

Thus for the *Area* of the *Triangle H A B*,

Multiply half the *Base H B* = 18,35

By the *Perpendicular A a* = 13

5505

1835

238,55 = the *Area*.

For the *Area* of the *Triangle F B C*,

Multiply —  $\frac{1}{2}$  *FC* = 19,25

By the *Perpendicular B d* = 18,5

9625

15400

1925

356,125 = the *Area*.

For the *Area* of the *Trapezium B H G F B*,

Multiply half the *Diagonal G B* = 20,8

By the *Sum* of the *Perpend. Hb + Fc* = 42,8

1664

416

832

890,24 = the *Area*.

For the *Area* of the other *Trapezium C D E F C*,

Multiply half the *Diagonal C E* = 27,55

By the *Sum* of the *Perpend. De + Ff* = 35,7

19285

13775

8265

To this last —

983,535 = the *Area*.

Add the other *Area's* —

890,24

356,125

238,55

The *Sum* of all is the *Content* =

2468,45 = the *Field*.

Now

*Mensuration of Superficies and Solids.* 359

Now if the Numbers are supposed to be *Poles* or *Rods*, Divide the Whole *Superficial Content* or *Area* of the *Field*, by 160, the Quotient will be the Number of *Statute Acres* the *Field* contains. See the Work.

$$\begin{array}{r}
 160) 2468,45 \text{ (15,4278 Acres;} \\
 \underline{16} \phantom{000000} \\
 86 \phantom{000000} \\
 \underline{80} \phantom{000000} \\
 68 \phantom{000000} \\
 \underline{64} \phantom{000000} \\
 \phantom{00} 44 \phantom{000000} \\
 \phantom{00} \underline{32} \phantom{000000} \\
 \phantom{0000} 125 \phantom{000000} \\
 \phantom{0000} \underline{112} \phantom{000000} \\
 \phantom{000000} 130 \phantom{000000} \\
 \phantom{000000} \underline{128} \phantom{000000} \\
 \phantom{00000000} \dots 2
 \end{array}$$

Acres Rod Rods Yards  
Or, 15 : 1 : 28 : 13

But if the *Field* was measured with a *Chain* of an 100 *Links* (= 4 *Rods*.) Then, because an *Acre* contains 10 *Square Chains*, and every *Square Chain* containing 10000 *Square Links*, therefore a *Square Acre* will contain 10000 *Square Links*; and hence the *Reason* of striking off 5 Figures to the Right-hand from a *Given Area* in *Links*, and taking the *Rest* for *Acres*. In this Case, the *Area* of the *Plot* above would be but ,0246845 of an *Acre*; i. e. about 3 *Poles* and 7 *Yards*, *Square Measure*.

But suppose the *Figure* above represent the *Plot* of a large *Common* whose *Dimensions* are taken in *Chains* and *Decimal Parts* of a *Chain*: Then the *Area* thereof would be 2468,45 *Square Chains*, which is 246,845 *Acres*; Or, 246 *Acres*, 3 *Roods*, 14 *Poles*.

And thus may any *Area*, or *Superficial Content* of any *Field* or *Plot* of *Ground* (found by some one of the first 19 *Propositions* of this *Chapter*) be turned or resolved into *Acres* by this *Proposition*.

*Note*, By the nineteenth *Proposition* you may find, with ease, the Number of *Miles* or *Acres* contained in the Whole, or any Part, of the *Superficies* of the *terrestrial Globe*; and of any *Province*, *Kingdom*, *Empire*, or *Nation* of the *World*;  
and

and it ought therefore to be well understood by all who would study *Political Arithmetick*, this being the most certain, curious, and principal Branch of that Art; 'Tho' it be not in every Tract on that Subject, nor in any Book of Mensuration that I know of.

Thus I have finished a Tract of *Planometry*, and *Stereometry*, or of the *Mensuration of Superficies and Solids*; containing a *Greater Variety* than I know to be in *many Books*, wrote wholly on the Subject, of two, three, or four *Shillings Price*; having endeavoured here, as in all other Parts of this *System*, to oblige the *Reader* with all that could be *useful* for him to know, in the most plain but *Compendious Manner*, at the easiest Rate.

*Urve, Vale; Si quid novisti rectius istis,  
Candidus imperti; si non, his utere mecum.*
